Cherubini, Maria Luigi Carlo Zenobi Salvatore, ma-rē'a loo-ē'jē kār-lō zā-nō'bē sāl va tō'rā kār-roo-bē'nē, Italian composer: b. Florence 8 Sept 1760; d. Paris 15 March 1842. In 1773 he produced a mass, which, with other of his compositions, attracted the attention of the grand duke Leopold, who enabled him to become a pupil of Sarti of Bologna, under whom he studied from 1778 to 1782. As early as 1780 he produced his first opera, 'Quinto Fabio,' at Alessandria, and in 1784 he had already produced eight operas in the theatres of Italy. In 1785 he composed for the London Italian opera 'La finta Principessa and Giulio Sabino'; in 1788 at Turin his 'Ifigenia in Aulida'; and in the winter of the same year he brought out his 'Demophoon,' and in 1791 his 'Lodoiska,' at Paris. The latter opera established his fame, and was followed by 'Élisa'; 'Médée'; 'L'hôtellerie Portugaise'; 'Les deux journées'; 'Anacréon'; and his ballet of 'Achilles at Scyros.' In 1806 he produced 'Faniska' at Vienna; in 1809, 'Pimmlione' at Paris; in 1813, 'Les Abencerrages'; in 1814, 'Bayard à Mézières'; in 1821, 'Blanche de Provence'; and in 1833, 'Ali Baba.' He excelled most in sacred music. His celebrated mass in F for three voices, his grand 'Requiem,' his 'Messi Sacrie,' are the noblest monuments of his genius. Haydn and Beethoven pronounced him the greatest sacred composer of the age. In 1822 he became director of the *conservatoire* of Paris, with which he had been connected from the date of its foundation in 1795, and which is greatly indebted to him for its prosperity. The most important of Cherubini's literary works is 'Méthode de contre-point et de fugue,' published in 1835, containing a summary of the lessons in strict composition which for several years he had given at the conservatory. He was enthusiastically devoted to his profession, and his independence as an artist frequently manifested itself. Napoleon for a long time could not forgive him, because on one occasion, when he rudely contradicted him on some point of music, the artist replied: "Citizen Bonaparte, in the art of war you are pre-eminent, but you should leave music to those who understand it."

Cherusci, kē-rūs'sī, the most celebrated of all the German tribes. It is difficult to determine their exact position, owing to the fact that ancient writers sometimes confound the national league formed by the Cherusci with the tribe, properly so called. It seems probable, however, that the tribe was situated in

CHERVIL — CHESAPEAKE AND LEOPARD

that part of Germany lying between the Weser and the Elbe, and having the Harz Mountains on the north and the Sudetic range on the south. This tribe was known to the Romans before 50 B.C. and it is mentioned by Cæsar as a people of equal importance with the Suevi. Their territory was first entered by the Romans under Drusus, the stepson of Augustus; and a year or two later they entered into an alliance with the Romans, and served in their armies. But when Varus attempted to make them tributary to Rome, and subject them to the Roman laws, they formed a confederation with many smaller tribes, and having decoyed Varus into the forest of Teutoburg, destroyed his whole army in a battle which lasted three days, and in which he himself was slain (9 A.D.). Upon this the Cherusci became the chief object of the attacks of the Romans. Germanicus, victorious over the Marsi and Chatti, marched against the Cherusci, whose leaders, Segestus and Arminius (the latter of whom had carried off the daughter of the former), were at war with each other. Segestus, pressed by Arminius, called Germanicus to his aid, who delivered him, indeed, from his danger, but was obliged to return after several campaigns without having obtained any permanent advantages. In the end the Cherusci were overcome by the Chatti in the second half of the first century of our era; but this seems to have been owing more to internal dissensions among themselves than to any natural superiority in their opponents. Before the end of the 4th century they appear as members of the great confederation of the Franks, and after that they are lost sight of.

Cher'vil, a popular name for several plants of the natural order *Umbellifera*. Leaf chervil or salad chervil (*Anthriscus cerefolium*) is an annual herb native to southern Europe, and has long been cultivated in Europe, but very little in America, for its sweet-scented compound leaves, which are used like parsley for garnishing, flavoring soups, stews, etc., and as a pot-herb. It is of easy cultivation and yields its leaves in about eight weeks from sowing the seed. In some localities it has escaped from gardens and has become a weed. Turnip-rooted or tuberous chervil (*Charophyllum bulbosum*) is a biennial or plur-annual herb native to southern Europe and has long been cultivated for its small grayish or blackish carrot-like roots, which are eaten either like beets or as a flavoring in soups, stews, etc. Since its seeds lose their vitality very quickly, they should be sown in the autumn, or else stratified until spring. If sown in the fall they need not be expected to appear before spring. Except as just mentioned, the cultivation of tuberous-rooted chervil resembles that of carrots. The name chervil is also sometimes given to sweet cicely (*Myrrhis odorata*), a native of southern Europe, widely cultivated in Europe, where it is also known as Spanish chervil, anise chervil, and myrrh.

Chéry Philippe, fê-lêp shâ-rê, French painter: b. Paris 15 Feb. 1759; d. 28 Feb. 1838. Espousing the cause of the Revolution, he took a part in the siege of the Bastille, and was successively a member of the Convention, member of the first committee of public safety, mayor

of Charonne and Belleville, and chief of police in the department of the Seine. Banished by Bonaparte after the 18th Brumaire, he did not return to France until 1802. His historical paintings gained for him a high reputation.

Ches'apeake and Delaware Canal. See CANAL.

Chesapeake and Leopard, Affair of the, 22 June 1807. The Chesapeake was a 40-gun frigate destined to relieve the Constitution in the Mediterranean; Capt. James Barron was to go out in her as commander of the Mediterranean squadron. She had been refitted at the Washington navy-yard, and made final preparations at Norfolk, reporting ready for service on 19 June. On the 22d she got under way, but expecting no attack from powers at peace with this country, was in no shape for immediate action, and being four months behind time, could not wait. The gun deck was obstructed with various lumber, sick seamen were lying on the upper deck, the cables were not stowed away, the powder-horns were not filled, and the crew was raw and not exercised at the guns. At this time, in the heart of the Napoleonic wars, the high wages and relatively safe employ of the American merchant and even naval service, with the rights of American citizenship immediately obtained, raised the normal rate of desertion from the British navy so much that its officers were much embarrassed and greatly incensed; and Great Britain claimed, as for many years afterward, the right of searching neutrals for deserters and contraband. At the same time, her press-gangs crimped for service any strays who could be caught, of any nationality, and rarely gave any redress. Early in 1807 a British fleet lay off Norfolk watching to intercept some French frigates in the Chesapeake; and a boat's crew deserted bodily and escaped to Norfolk. The captain was told that they had enlisted on the Chesapeake,—which was true of only one, and he under an assumed name; and meeting the latter and another deserter in the streets of Norfolk, was defied. Another vessel, the *Melampus*, reported three deserters gone to the Chesapeake, but it was proved that they were native Americans illegally pressed. Admiral Berkeley, at Halifax, on complaint of his officers, ordered any of his vessels to overhaul and search the Chesapeake on meeting her outside the United States jurisdiction. The order was carried by the 52-gun flagship, *Leopard*, Capt. Humphreys, who, after consulting with the local commandant at Lynnhaven, followed the Chesapeake out beyond Cape Henry, hailed her, and sent a boat with a copy of Berkeley's order. Barron, who believed that he had no deserters aboard except the *Melampus*, which were not really such, honestly denied having any, but refused the right to search; the messenger lieutenant at once left, and within five minutes the *Leopard* came closer, and Humphreys announced that he should carry out his orders. Barron at once called his men to quarters, and did everything that skill, coolness, and courage could do to prepare for action, but the *Leopard* almost at once poured her whole broadside into the Chesapeake, and then two more in rapid succession, without the possibility of her opponent replying. Three of

CHESAPEAKE AND SHANNON—CHESAPEAKE STAGE

the latter's men were killed, Barron and 17 others wounded, and it was certain that the vessel would be sunk in a short time if the fire kept up, and Barron, to stop a useless massacre, struck his flag. The one English deserter was hunted out and hanged, the three Americans taken and imprisoned. The mass of the country was on fire with indignation; the extreme Federalists at first justified the English course, but were compelled by public feeling to exhibit some patriotism. Even the timid Jefferson, whose course had brought on the catastrophe, interdicted British cruisers from American ports, and demanded disavowal and reparation from Great Britain, which were not given; but he did nothing to prevent the recurrence of such outrages. The unfortunate Barron, who had behaved like a brave man and good officer, and whose instructions had bound him to do nothing to bring on collisions, was made the scapegoat of the popular fury. His own captain screened himself by accusing him, and a court-martial on board his own vessel from 4-8 Jan. 1808. Capt. John Rodgers president, after acquitting him of all blame in every respect but one, found him guilty in not preparing for action as soon as he read Admiral Berkeley's order, and sentenced him to five years' suspension without pay or emoluments. The gross injustice of this is now admitted. One of the judges was Stephen Decatur (q.v.), who never ceased reflecting on Barron till the latter challenged and killed him.

Chesapeake and Shannon, Battle of, 1 June 1813. In the War of 1812, the former vessel (see above) cruised to no purpose from December 1812, till April 1813, and arrived at Boston 9 April. Her captain, Evans, left her on account of ill health, and about the middle of May was replaced by Capt. James Lawrence, famous for the brilliant victory of the Hornet over the Peacock. He accepted against his will; nearly all the officers and crew were new, and the latter second-rate, totally untrained, and sulky over questions of prize money. On 25 May Capt. Broke of the Shannon, lying outside, sent away his consort, the Tenedos, to have a fair chance to fight the Chesapeake alone, and repeatedly urged Lawrence to arrange a duel between the ships. In theory they were evenly balanced; they were of almost exactly the same length; the Chesapeake now carried 50 guns, the Shannon 52; the Chesapeake had 379 officers and crew against the Shannon's 330, but the latter had been trained for seven years under Broke himself, kept in constant artillery and other practice, and was a thoroughly disciplined fighting machine, men used to each other and the officers. On 1 June, however, Lawrence, whose experience had made him despise British skill and courage alike, sailed out to meet his enemy, and at 5.30 P.M. they engaged. After a couple of broadsides, the Shannon's shot cut the Chesapeake's stays, and the latter drifted helplessly stern foremost toward her adversary. There was no salvation but to make sail forward or to board, and both were impossible. The Shannon's broadsides and the musketry fire from her tops swept the Chesapeake diagonally from stem to stern, without the latter being able to fire a shot in reply,

beating in the stern ports and killing or wounding every man on the quarter-deck and the after part, including the men at the wheel. Just before the vessels struck, Lawrence ordered up his boarding party; but almost at the same instant he fell mortally wounded by a musket ball, and was carried below. Not a living person was on the quarter deck, and Broke, with 50 boarders rushed on board unresisted just as the vessels parted. He was in deadly peril from his own guns, which killed his first lieutenant as the latter pulled down the American flag, and so fierce was the resistance from the 30 or so of the American crew who had rallied at the fore-castle, that 37 of the boarding party were killed or wounded, including Broke himself. Had the rest of the crew shown even decent pluck, not one of the British would have escaped; but the upper party, heavily overmatched, were killed or driven below, and though the dying Lawrence called out from the cockpit, "Don't give up the ship! Blow her up!" the remainder refused to go above, and surrendered. The Chesapeake lost 61 killed and 85 wounded; the Shannon 33 killed and 50 wounded. The former was towed into Halifax as a prize, turned into a British war vessel, and in 1820 broken up. Lawrence died four days after the battle.

Chesapeake Bay, in Maryland and Virginia, and dividing the former State into two parts, is the largest inlet on the Atlantic coast of the United States, being 200 miles long, and from 4 to 40 broad. Its entrance, 12 miles wide, has on the north Cape Charles, and on the south Cape Henry, both promontories being in Virginia. The bay has numerous arms, which receive many navigable rivers, such as the Susquehanna on the north, the Potomac, Rappahannock, and York on the west, and the James on the southwest. Unlike the shallow sounds toward the south, this network of gulfs and estuaries, with its noble feeders, affords depth of water for ships of any burden, virtually carrying the ocean up to the wharves of Baltimore and the arsenal of Washington.

Chesapeake Bay Dog, the American retriever, so named from the district in which it first became well known. It is a large animal, with a thick coat about an inch and a half long, with an under coat of soft woolly fur to protect the skin. Its legs are rather short, and the feet are well webbed, and it is held to be the finest retriever in the world.

Chesapeake Stage. The rocks of the Chesapeake Stage, a younger Miocene of the Atlantic coast, are clays and marls in the north, and marls and limestones in the south. They differ chiefly from the older Miocene, or Chatahoochee and Chipiolo Stages, in the character of the fossils, particularly in the north; these fossils indicating that the climate was much colder in the newer than in the old Miocene. This change of climate is believed to have been due to a change in the direction of the Gulf Stream, which flowed farther from the coast than before. The stage is well developed at Duplin County, N. C., at Yorktown, Va., and along rivers in Maryland. Strata of this age are found at Martha's Vineyard, Mass., and in Texas. See **MIOCENE SERIES; TERTIARY SYSTEM.**

CHESEBRO — CHESS

Chesebro, chēz'brō, Caroline, American novelist: b. Canandaigua, N. Y., 30 March 1825; d. Piermont, N. Y., 16 Feb. 1873. In 1851 a collection of her writings was published entitled 'Dream Land by Daylight: a Panorama of Romance.' This was followed by 'Isa, a Pilgrimage' (1852); 'Victoria, or the World Overcome' (1856); 'Philly and Kit' (1856); 'Peter Carradine' (1863); 'The Beautiful Gate, and Other Tales' (1863); 'The Foe in the Household' (1871); her best work.

Cheselden, chēs'ēl dēn, William, English surgeon and anatomist: b. near Melton, Mowbray, Leicestershire, 1688; d. Bath 10 April 1752. At the age of 22 he began to give lectures on anatomy, and in 1711 he was chosen F.R.S. In 1713 he published a treatise on the 'Anatomy of the Human Body,' long a favorite manual of the science. He continued to read his lectures for more than 20 years, during which he gradually rose to the head of his profession. In 1723 he published a 'Treatise on the High Operation for the Stone.' In 1733 was published his 'Osteography, or Anatomy of the Bones.' Cheselden obtained in 1737 the appointment of chief surgeon to Chelsea Hospital, a situation he held till his death.

Cheshire, chēsh'ēr, Joseph Blount, American Protestant Episcopal bishop: b. Tarboro, N. C., 27 March 1850. He was graduated at Trinity College in 1869, and practised law from 1872 to 1878. He was ordained to the priesthood in 1880, and, after holding various rectorships, became Bishop of North Carolina in 1893.

Cheshire, or Chester, a maritime county of western England, bounded by seven other counties in England and Wales, by the estuaries of the Dee and Mersey, and by the Irish Sea. Its area is 1,026 square miles, of which the greater part is under cultivation. The surface is generally level, the soil mostly a rich reddish loam variously clayey or sandy. There is some of the finest pasture land in England; and cheese, the main product of the Cheshire farmer, is made in great quantities. Extensive tracts of land are cultivated as market-gardens, the produce being sent to Liverpool, Manchester, and other towns. Minerals abound, especially rock-salt and coal, which are extensively worked. Cotton manufacture is carried on at Stockport, Stalybridge, and in the northeastern district, ship-building at Birkenhead and other places. There are numerous railroad lines and a splendid system of canals. The principal towns are Chester, the county town, Macclesfield, Stockport, Birkenhead, and Stalybridge. Pop. 815,000.

Cheshire Cheese. See **CHEESE**.

Chesney, chēs'nī, Charles Cornwallis, English soldier and author: b. 6 Sept. 1826; d. 19 March 1876. He was a well known military engineer, but was still better known as a writer on military themes, publishing 'Campaigns in Virginia' (1863); 'Waterloo Lectures' (1868); 'Military Biographies' (1870). The last named volume contained essays on Gens. Grant and Lee. He was a nephew of F. R. Chesney (q.v.).

Chesney, Francis Rawdon, English explorer: b. Annalong, County Down, Ireland, 1789; d. Mourne 30 Jan. 1872. He was gazetted to the Royal Artillery in 1805. In 1829 he inspected the route for a Suez canal which he proved to be practicable. His first exploration of the route to India, by way of Syria and the Euphrates, was made in 1831, and he made three other voyages with the same object. The idea was taken up by government, who made a grant of £20,000 after his first expedition, but owing to the opposition of Russia it was never brought to a practical issue. He commanded the artillery at Hong Kong from 1843 to 1847. In 1850 he published his 'Expedition for the Survey of the Rivers Euphrates and Tigris,' and in 1868 a 'Narrative of the Euphrates Expedition.' See 'Life,' edited by Lane-Poole (1885).

Chesney, Sir George Tomkyns, English writer: b. 1830; d. 1895. He was a colonel in the army, and later a general and K.C.B. and sat in the House of Commons for Oxford in 1892. But he will be longest remembered for his remarkable realistic 'Battle of Dorking' (q.v.) (1871); and his brilliant novel, 'The Private Secretary' (1881).

Chesnut, Victor King, American botanist: b. Nevada City, Cal., 28 June 1867. He graduated at the University of California in 1890 and pursued post-graduate work at the University of Chicago and at Columbia University. In 1894 he became assistant botanist in charge of poisonous plant investigation, carried on by the United States Department of Agriculture. He has written: 'Principal Poisonous Plants in the United States'; 'Thirty Poisonous Plants of the United States'; and 'Preliminary Catalogue of Plants Poisonous to Stock.'

Chesnutt, Charles Waddell, American author: b. Cleveland, O., 20 June 1858. While still a child he was taken to North Carolina, where he was educated, becoming subsequently principal of the State Normal School at Fayetteville. He removed to New York and entered journalism temporarily, returning later to Cleveland, where he was admitted to the bar in 1887. He has written 'The Conjure Woman'; 'The Wife of His Youth and Other Stories'; 'Life of Frederick Douglass' (in 'Beacon Biographies'); 'The House Behind the Cedars'; and 'The Marrow of Tradition.'

Chess, a well-known game of great antiquity and of Eastern origin, having probably arisen in India, and thence spread through Persia and Arabia to Europe. The name itself, as well as many of the terms used in the game, are clearly Eastern, the word "chess" being formed from the old French *eschecs*, from Persian *shāh*, "a king"; "rook" is from the Sanskrit *roka*, meaning a "ship" or a "chariot"; "checkmate" from Persian *shāh, māt*, "the king is dead." The game is played by two persons on a board, which is divided into 64 squares arranged in eight rows of eight squares each, alternating black and white, or black and red. Each player has 16 men, eight of which, known as "pawns," are of the lowest grade; the other eight, called "pieces," are of various grades. They are, on each side,

CHESS

"king" and "queen"; two "bishops," two "knights," and two "rooks" or "castles." The board must be placed so that each player shall have the single white square of his rear row to his right hand. The men are then set upon the two rows of squares next the players; the pieces on the first or rear row; the pawns on the second or front row, leaving between each side four unoccupied rows. The king and queen occupy the central squares, facing the corresponding pieces on the opposite side. The queen always occupies the central square of her own color. The two bishops occupy the squares next the king and queen; the two knights the squares next the bishops; the rooks the last or corner squares. The pieces standing on the king's or queen's side of the board are named respectively king's (or queen's) bishop, knight, or rook. The pawns are named from the pieces in front of which they stand; as king's, king's knight's, queen's rook's pawn, etc. For purposes of chess notation the names of the men are contracted as follows:

King	K.	Queen	Q.
King's bishop	K.B.	Queen's bishop	Q.B.
King's knight	K.Kt.	Queen's knight	Q.Kt.
King's rook	K.R.	Queen's rook	Q.R.

The pawns are indicated by adding the initial P. to the abbreviations of the names of the pieces noted above.

The squares on the board are known as rows and files, the rows running across the board in relation to the players, and the files directly from opponent to opponent. Each file is named from the piece which occupies its first square, and, counting inversely from the position of each player to that of the other, the rows are numbered from 1 to 8. At White's right-hand corner we have thus K.R. square; immediately above this K.R. 2; and so on to K.R. 8, which completes the file; the second file begins with K.Kt. square on the first row, and ends with K.Kt. 8 on the eighth. White's K.R. 8 and K.Kt. 8 are thus Black's K.R. square and K.Kt. square, and the moves of each player are described throughout from

his own position, in inverse order to the moves of his opponent.

In chess all the men capture by occupying the position of the captured man, which is removed from the board. The ordinary move of the pawn is straight forward in the same file; a pawn never moves backward. The first time a pawn is moved it may be played forward one square or two; afterward only one square at a time. But in capturing an adverse piece the pawn moves diagonally to occupy the position of the captured man. Thus if White opens a game by playing his pawn to K. 4 and Black answers by advancing his pawn to K. 4, the pawns are immovable; but if White now plays a pawn to K.B. 4 or Q. 4, Black may capture the pawn last advanced. Pawns have another mode of capture peculiar to themselves, and only available against pawns. If Black's pawn, instead of occupying K. 4, stood on K. 5, and White played his pawn to Q. 4, Black could not capture it by placing his pawn on the square it occupies, which would be a false move; but he is at liberty to make the capture by placing his own pawn on the square passed over by White's (Q. 6). This is called taking *en passant*. When a pawn, by moving or capturing, reaches the eighth square of any file, it can no longer remain a pawn, but must be exchanged for a piece. The player may choose any piece except the king, but the queen, on account of her power, is generally the one chosen. This is called "queening" a pawn, and a player may thus have several queens on the board. The moves of the pieces are not, like those of the pawns, limited to a single direction. The rook moves in any direction and for any distance that is open along the particular row or file on which it happens to stand. It can capture any obstructing man and occupy its place. The bishop's moves are unlimited in range, and may be either backward or forward; but their direction is diagonal, and they can never change the color of their square. The queen combines the moves of both rook and bishop. She is the most powerful piece on the board, and can move to, or capture at, any distance or direction in a straight line. The king is at once the weakest and the most valuable piece on the board. In point of direction he is as free as the queen, but for distance he is limited to the adjacent squares. Standing on any central square he commands the eight squares around him and no more. Besides his ordinary move the king has another by special privilege, in which the rook participates. Once in the game, if the squares between the king and either his or the queen's rook are clear; if neither the king nor the rook has moved; if the king is not attacked by any hostile man; and if no hostile man commands the square over which the king has to pass, the king may move two squares toward either rook, and the rook, in the same move, must occupy the square over which the king has passed. This is called "castling." The knight, unlike the other pieces, never moves in a straight line. His move is limited to two squares at a time, one forward or backward and one diagonally, and he can leap over any man occupying a square intermediate to that

CHEST — CHESTER

to which he intends to go. The knight, like the king, when on a central square, commands eight squares, but they are at two squares' distance, and all in an oblique direction. All captures in chess are optional.

The definite aim in chess is the reduction to surrender of the opposing king. The king is supposed to be inviolable; that is, he cannot be taken: he can only be placed in such a position that if he were any other piece he would be taken. Notice of every direct attack upon him must be given by the adversary saying "Check," and when the king is attacked all other plans must be abandoned, and all other men sacrificed, if necessary, to remove him from danger, cover the attack, or capture the assailant. It is also a fundamental rule of the game that the king cannot be moved into check. When the king can no longer be defended on being checked by the adversary, by moving him out of danger, by interposing, or by capture, the game is lost, and the adversary announces this by saying "Checkmate!" When, by inadvertence or want of skill, the player having the superior force blocks up his opponent's king so that he cannot move without going into check, and no other man can be moved without exposing him, the player, reduced to this extremity, cannot, without violating the fundamental rule referred to, play at all. In such a case, the one player being unable to play and the other out of turn, the game is considered "drawn," that is, concluded without advantage to either player. The position is known as a stalemate. The laws of the game must be sought in some special manual. Perhaps the best code is that given in Staunton's 'Chess Praxis.'

Chest, in man and the higher vertebrates, the cavity formed by the breastbone in front and the ribs and backbone at the sides and behind, shut off from the abdomen below by the diaphragm or midriff. It contains the heart, lungs, etc., and the gullet passes through it. See THORAX.

Chest-foundering, a disease in horses, a rheumatic affection of the muscles of the chest and fore-legs, impeding both respiration and the motion of the limbs. It in some degree corresponds with what is called pleurisy in man.

Ches'ter, Albert Huntington, American chemist and mineralogist: b. Saratoga Springs 22 Nov. 1843. He graduated from the Columbia School of Mines in 1868 and became a mining engineer. From 1870-92 he was professor of chemistry in Hamilton College. He has written a 'Dictionary of the names of Minerals'; and 'Catalogue of Minerals With Their Chemical Compositions and Synonyms.'

Chester, Colby Mitchell, American naval officer: b. New London, Conn., 29 Feb. 1844. He graduated at the United States Naval Academy in 1863; fought under Farragut in the famous battle of Mobile Bay; became captain 12 June 1896; was commandant of cadets at Annapolis 1890-4; commanded the Galena, Richmond, Newark, Minneapolis 1895-7; the Cincinnati during the war with Spain, and in 1899 was placed in command of the new and powerful battleship Kentucky.

Chester, Joseph Lemuel, American genealogist: b. Norwich, Conn., 30 April 1821; d. London, England, 26 May 1882. His earlier life was taken up chiefly with mercantile pursuits, but his strong literary tastes found expression in contributions to the 'Knickerbocker.' From 1845 to 1850 he was musical editor of Godey's 'Lady's Book,' and in 1852 became one of the editors of the Philadelphia *Inquirer*, and of the *Daily Sun*. In 1858 he went to England to sell some patent rights, but not succeeding in the undertaking, settled in London, and devoted himself to genealogical investigation. For more than 20 years he collected materials illustrating the ancestry of American families, made special researches for clients, and investigated the English descent of noted Americans, especially that of George Washington. His greatest work was the editing and annotating of 'The Marriage, Baptismal and Burial Registers of the Collegiate Church or Abbey of St. Peter, Westminster,' dedicated to the queen (1876), a work that cost him 10 years' labor, and which he generously allowed the Harleian Society to issue as one of its publications. He was a founder of this society in 1869, and edited five of its volumes. He was also a member of the Royal Historical Society, and of many other learned societies in England and America. His non-genealogical writings were: 'Greenwood Cemetery, and Other Poems' (1843); 'Treatise on the Law of Repulsion' (1853); 'Educational Laws of Virginia: the Personal Narratives of Mrs. Margaret Douglas' (1854); 'John Rogers, the Compiler of the First Authorized English Bible, the Pioneer of the English Reformation, and its First Martyr' (1861), a work of great industry and research.

Chester, England, an ancient and episcopal city, the capital of the county of Cheshire, 16 miles southeast of Liverpool. The two main streets cross each other at right angles, and were cut out of the rock by the Romans four to ten feet below the level of the houses. The houses in these streets were curiously arranged; the front parts of their second stories, as far back as 16 feet, form a continuous paved promenade or covered gallery, open in front, where there are pillars and steps up from the street below, with private houses above, inferior shops and warehouses below, and the chief shops of the town within. St. John's Church, now partially in ruins, is supposed to have been founded by Ethelred in 698. Chester still preserves its old walls, two miles in extent, and the gateways have been rebuilt during the last century. Pop. (1901) 36,281.

Chester, Pa., a city and port of entry of Delaware County, on the Delaware River, and the Philadelphia, Wilmington & Baltimore, the Baltimore & Ohio, and the Philadelphia & Reading R.R.'s, 15 miles south of Philadelphia. The favorable location and excellent shipping facilities of the city have given it a diversity of industries.

Business Interests.—Chester is the local trade centre of a very prosperous agricultural and manufacturing district. It is the site of the Roach ship yards, where several vessels of the United States navy have been built. According to the Federal census of 1900 Chester

CHESTER — CHESTNUT

had 315 manufactories, employing \$18,977,710 capital and 7,682 hands, and having annual products to the value of \$16,421,725. The principal industries were ship-building, foundry and machine-shop work, and the manufacture of cotton, woolen, and worsted goods. In 1900 there were three national banks with \$700,000 capital and a surplus of \$575,000, several private banking houses, daily and weekly newspapers, and an assessed property valuation of \$42,000,000.

Public Interests.—Chester is connected with Media, Darby, and other surrounding towns by electric railways. It is the seat of the Pennsylvania Military College and Crozier Theological Seminary, and Swarthmore College is nearby. The notable buildings are the United States Government Building, including the post-office; the city hall, erected in 1724, of great historic interest; Chester and Homœopathic hospitals, and the public library. Besides the educational institutions mentioned, there were at the close of the school year 1897-8, 23 public schools, with 125 teachers and 5,446 pupils, and public school property valued at \$500,000; a public high school, and Chester Academy.

History.—Chester was settled by the Swedes in 1643, under the name of Upland, and is the oldest town in the State. It was incorporated in 1866. Pop. (1900) 33,988.

Chester, S. C., capital of Chester County, on the Cheraw & Chester, the Chester & Lenoir, and the Seaboard Air Line R.R.'s, 65 miles north-northwest of Columbia. It is a trade centre, cotton is the chief shipping product. Pop (1900) 4,680.

Chester Stage, the youngest of the limestones laid down in the interior sea that covered, in Lower Carboniferous or Mississippian time, much of what is now the Mississippi valley. Limestones of this stage are found in Texas, Arkansas, Kentucky, Tennessee, and Alabama, and in places reach a thickness of 600 feet. Some of the Lower Carboniferous limestones of West Virginia correspond in age to the Chester. The characteristic fossils include several genera of lamellibranchs and brachiopods. See CARBONIFEROUS; (*Mississippian*.)

Ches'terfield, Philip Dormer Stanhope, 4th EARL OF, English statesman and orator: b. London 22 Sept. 1694; d. 24 March 1773. On the accession of George I Gen. Stanhope, his great-uncle, procured him the place of gentleman of the bed-chamber to the Prince of Wales; and the borough of St. German, in Cornwall, elected him to Parliament, though he had not yet attained the legal age. He soon acquired distinction as a speaker, which he maintained also in the Upper House after his father's death in 1726. In 1728 he was appointed ambassador to Holland, and succeeded in delivering Hanover from the calamities of the war by which it was threatened. He was afterward, in 1744, appointed lord-lieutenant of Ireland, and on his return in 1746 received the place of secretary of state; but in 1748 retired from public affairs, and devoted the remainder of his life almost entirely to study and the society of his friends. His talents as an author were displayed in several moral, critical, and humorous essays, in his parliamentary speeches, which were printed at a later period, and particularly in a collec-

tion of 'Letters to his Son' (1774), which have become famous. To the charms of wit and grace he united good sense, a thorough knowledge of the manners, customs, and the political condition of Europe, and a polished style. The moral tone of his letters, however, is low. One is shocked to hear a father recommending to his son grace of manners as the most essential quality for a man of the world, and even instigating him to licentious irregularities. Another series of letters addressed to his godson, and published in 1889, show Chesterfield in a more favorable light.

Chesterfield's Letters to His Son. (1774.) These were not written for publication, but were intended by Chesterfield to aid in training his son and forming his character; and were first given to the public after the Earl's death. Begun when the boy was but seven years old, the earlier ones are filled with rudimentary instruction regarding history, mythology, and the use of good language; later follows what has been called "a charming course of worldly education," in which mingle philosophical truths, political sophistries, petty details regarding wearing apparel, and so on. Almost every page contains some happy observation or clever precept worthy to be remembered. The letters show evidences of the lax morality of the times; but are remarkable for choice of imagery, taste, urbanity, and graceful irony.

Chesterfield, England, a town in Derbyshire, on the Midland Railway, 24 miles north of Derby. It has a large market-place and five principal streets, and is irregularly but substantially built. Among its public buildings are a large parish church, noteworthy for its crooked wooden spire 250 feet high, a commodious town-house, guild-hall, grammar-school, the Stephenson Memorial Hall, and the Chesterfield Institute. The principal manufactures are ginghams, lace, earthenware, leather, etc., but a majority of the working people are employed in connection with the collieries, iron-mines, quarries, and blast-furnaces of the vicinity. There are also iron-foundries, corn-mills, and engine-works. Mrs. Radcliffe, the celebrated romance-writer, was born at Chesterfield, and a branch of the Stanhope family takes the title of earl from it. Pop. (1891) 22,009; (1901) 27,185.

Chesterfield Inlet, Dominion of Canada, an inlet of Hudson Bay, 250 miles long, and 25 miles across at its widest part. It receives the waters of several rivers, and contains numerous small islands.

Ches'terton, Gilbert K., English author: b. London. He has published 'Wild Knight and Other Poems'; 'The Defendant'; 'Carlyle' (1903); 'Browning' (1903).

Chesterton, George Laval, English sporting journalist: b. London 20 July 1856. He entered a newspaper office in Exeter at 14, was bandsman in the Third Dragoon Guards, 1875-8, special correspondent to the London *Morning Advertiser* from Bechuanaland, 1884-5, and since 1892 has been sporting correspondent to the *Morning Advertiser* over the signature 'Arion.' He has published: 'Racecourse Reminiscences'; 'Racing Reflections'; 'Won by a Head.'

Chestnut, chēs'nūt, a genus of trees, and shrubs (*Castanea*) of the natural order *Cupu-*

CHESUNCOOK — CHEVALIER

liferæ. The species are characterized by long male catkins and bristly ovaries (burs) which contain rounded nuts. Three species are of wide economic use, their wood being used for many purposes, their bark for tanning, and their nuts for food. In America the most important species is the common chestnut (*C. americana*), by some writers considered a variety of *C. sativa*), which is a tall spreading tree often attaining a height of 100 feet and a girth of 10 or more feet in the forests, which are usually upon high gravelly or sandy land or mountain sides where clay and limestone are absent or in but slight evidence. Its range is from New England to the high lands of Alabama and westward to southern Michigan. During the closing half of the 19th century this species attracted the attention of horticulturists, who have produced about a score of improved varieties worthy of being cultivated for their nuts. The Japanese chestnut (*C. crenata*, by some botanists considered a variety of *C. sativa*), has long been cultivated for its large nuts, which are produced by very young trees and are highly prized for food. The trees are rather dwarf, compact and symmetrical, and free from the attacks of blights, qualities which, together with their ease of propagation, have commended them to orchardists throughout the world. During the closing years of the 19th century it came into prominence in America. The European chestnut (*C. sativa*) a native of southern Europe, northern Africa, and western Asia, is a large tree which forms great forests throughout its range. Its nuts are probably more widely used as food than those of either of the other species, being a principal article of diet in the western countries bordering the Mediterranean Sea. In America it has become popular with orchardists on account of its large nuts. Of the three species the American produces the finest-flavored nuts, but they are generally much smaller than those of the other two species.

Two other American species are valued for their nuts. The tree or common chinquapin (*C. pumila*), which is usually less than 10 feet tall, but occasionally attains a height of 30 feet or even more, is found from Pennsylvania to Florida and westward to Indiana and Texas. The bush chinquapin (*C. alnifolia*, considered by some botanists a variety of *C. pumila*) rarely attains a height of five feet. It is found in the South Atlantic States and westward to Arkansas. Both these species bear small ovoid pointed nuts about half the size of ordinary American chestnuts. They are as yet little cultivated and have produced few varieties.

The various species and their varieties are readily propagated from seed. The seedlings are, however, generally grafted to choice varieties, and when the grafted plants are one or two years old they are set in orchards and cultivated like other fruits or are allowed to care for themselves. In places where chestnuts grow naturally, the sprouts which arise from the stumps of felled trees are often grafted with European or Japanese varieties, and the land pastured with sheep. The principal enemy of the chestnut is the weevil, a beetle which lays its eggs in the young nuts and destroys them or injures them so much as to prohibit their sale when mature. No satisfactory remedy or preventive has yet been discovered.

Chestnuts are eaten raw, boiled, or baked, or are used in many culinary preparations such as dressings. They are often dried and ground into flour, which is used like wheat flour in bread- and cake-making. Sometimes they are used for making confectionery. Fresh chestnuts have the following average percentage composition: Water, 45.0; carbohydrates (principally starch), 42.1; protein, 6.2; fat, 5.4; ash, 1.3.

Chesuncook (chē-sūn'kūk) Lake is in Piscataquis County, Maine. It is really an expansion of the Penobscot River, is 20 miles long, and 2,500 feet above sea level.

Chettik, chēt'ik, a tree of Java, the *Strychnos Tieute*, yielding a very virulent poison called by the same name, more powerful than that obtained from the upas-tree, and owing its virulence to the strychnine it contains.

Chet'tle, Henry, English dramatist and pamphleteer; d. about 1607. He was editor of Greene's 'Groat'sworth of Wit' (1592), wrote 13 plays of considerable merit, and was part author of 35 others; including 'Robin Hood' in two parts; 'Patient Grisell'; 'The Blind Beggar of Bethnal Green'; and 'Jane Shore.' In Mere's 'Palladis Tamia' (1598) he is mentioned as one of the "best for comedy amongst us." Of his other works, his 'Kind-Hart's Dreame' (1593?), and 'Englande's Mourning Garment' (1603), are of interest, the former as containing an apology undoubtedly intended for Shakespeare as one of those whom Greene had attacked; the latter, a stanza supposed to be addressed to Shakespeare as "silver-tongued Melicert."

Cheval, shē-vāl, **A** (French, from the word meaning horse), on horseback, astride any object. In a military sense, a body of troops is said to be *à cheval* of a river, if one wing is stationed on the right and the other on the left bank.

Chevalier, shē-vā-lē-ā, **Albert**, English comedian; b. 21 March 1861. He is of Italian, French and Welsh blood. His first appearance was at the age of eight. For many years he was associated on the stage with the Kendals, John Hare, etc. For four years he appeared in music halls, then he came into vogue as a drawing-room entertainer with his coster ballads. He has made tours in England and America and has given 1,000 recitals at Queen's Hall, London. Besides 100 sketches, monologues and plays, he has written, 'Before I Forget.'

Chevalier, Michel, mē-shēl, French economist; b. Limoges 13 Jan. 1806; d. Montpellier 28 Nov. 1879. He was educated as an engineer in the School of Mines, joined the Saint Simonians, and suffered six months' imprisonment for promulgating the free doctrines of Père Enfantin's party. On his liberation he renounced his extreme doctrines, and was sent to the United States and to England on special missions. He became a councilor of state (1838), professor of political economy in the Collège de France (1840), member of the chamber of deputies (1846), and member of the Institute (1851). He published 'Letters on North America' (1836); 'On the Materials of Interest in France'; 'Essays on Industrial Politics'; 'Course in Political Economy'; 'His-

CHEVALIER—CHEVIOT

tory and Description of the Ways of Communication in the United States' (1840-2); 'Mexico: Ancient and Modern' (1863). He was known as a strong advocate of free-trade, and as a specialist on questions of currency. With Cobden and Bright he had a great part in the commercial treaty of 1860 between France and Great Britain.

Chevalier, shĕ-vā-lĕ-ā or shĕv-ā-lĕr', an honorary title given, especially in the 18th century, to younger sons of French noble families. Brought up in comparative luxury, and left at the death of their fathers almost entirely unprovided for, these men generally lived at the expense of others, as a sort of aristocratic parasites, even when they did not prefer recourse to such less honorable means of livelihood as gave occasion to the synonym for swindler, *chevalier d'industrie*. In the plays of the 18th century the chevalier is a constant figure. Both the Old and Young Pretender were each called the Chevalier by their partisans. The word is at present often used with its old meaning, and a chevalier may mean a man of honor.

Chevaux de Frise, shĕ-vō-de-frĕz (Friesland horses, so called because first used at the siege of Groningen, in that province, in 1658), armed beams of square timber or iron used to defend the fronts of camps, breaches, etc. They are usually from 15 to 18 feet long, and connected by chains, each being perforated with small holes to receive rods of wood or iron, pointed at their extremities, and when moved in any direction making a sort of hedge of spears.

Cheverus, shĕ-vrŭs, **Jean Louis Anne Madeline Lefebvre de**, le-lāv-r de, French bishop and cardinal of the Roman Catholic Church: b. Mayenne, France, 28 Jan. 1708; d. Bordeaux 19 July 1836. He was destined for the Church and at the early age of 12 years received the clerical tonsure, he was ordained priest in 1790. Refusing to take the constitutional oath regarding the clergy he was imprisoned at Paris as contumacious in 1792, but escaped to England. There he soon acquired the English language and engaged in missionary work, but in 1796 came to Boston, Mass., where he was soon in high repute for his kindly Christian demeanor and his graceful and winning pulpit eloquence. In an epidemic of yellow fever in the city he won the hearts of all men by his heroic self devotion in ministering bodily and spiritually to the stricken. Learning of the spiritual destitution of the Catholic Abenaki Indians on the Penobscot and the Passamaquoddy in Maine, he began the study of their language, and having attained some proficiency in it he visited their settlements and remained among them at his first visit three months; and every year thereafter he repeated his visit to them, built them a church, and procured for them a missionary priest, who thereafter till his death, 20 years later, devoted himself to their spiritual care. On the occasion of a visit of President John Adams to Boston, the two seats of honor at a public banquet were reserved for the chief magistrate and the priest. Mr. Adams' name headed the list of names of subscribers to a fund to erect a church for

Cheverus' congregation. In 1810 he was consecrated bishop of Boston and entered on the duties of the episcopate with a zeal and industry that taxed his strength to the utmost, and his physicians in 1823 counseled his return to his native land. There the French king, Charles X., named him to be bishop of Montauban, and in this new field his religious and charitable zeal was not relaxed: on the occasion of a disastrous flood he harbored in his episcopal residence 300 destitute people. In 1826 he was made bishop of Bordeaux and a peer of France by King Charles X. Here in a visitation of cholera he placarded his episcopal palace as a *maison de secours* or dispensary. At the instance of King Louis Philippe the Pope, Pius VII., in 1836 created him a cardinal. See Life, by Huen-Dubourg (1837).

Cheves, chĕvz, **Langdon**, American statesman: b. Rocky River, S. C., 17 Sept. 1776; d. Columbia, S. C., 25 June 1857. He began to study law at the age of 18, entered upon his profession with superior natural qualifications and after severe discipline, he rapidly attained eminence and wealth in its practice. He was a representative in the national congress before and during the War of 1812, and was a zealous supporter of the party which carried the declaration of war. He was chairman of the Naval Committee in 1812, and of the Committee on Ways and Means in 1813, and constantly opposed the restrictive system. When Henry Clay was sent as commissioner to Ghent, Cheves succeeded him as speaker of the House. He retained this office till 1815, and not one of his decisions was reversed by the House. The bill for the recharter of the United States bank in 1815 was lost by his vote. The national bank having been rechartered in 1816, that institution under injudicious management had become hard pressed and was on the verge of stoppage in 1819, when Cheves was elected president of its board of directors. By a rigorous system of retrenchment, and by making credits only upon sufficient securities, the bank was saved, and specie payments maintained at the principal centres of commerce; but the public clamor increased against the power of an institution charged with subjecting to itself all the monetary concerns of the country, and even the national treasury. Resigning this arduous office after three years, he became chief commissioner under the treaty of Ghent for settling some of its provisions. He returned to South Carolina, concentrated his labors upon his plantation, and though retaining his interest in public affairs, declined to accept any further public office.

Chevet, shĕ-vā, a variety of the apse, almost exclusively confined to French Gothic churches. The extreme end of the chancel or choir is called the chevet.

Cheviot (chĕv'ī-ŭt) **Hills**, a range on the borders of England and Scotland, stretching southwest to northeast for above 35 miles. Their culminating point, known specially as the Cheviot, has a height of 2,676 feet; Carter Fell, the next in height, is a little more than 2,000 feet high. They are clothed for the most part with a close green sward, and are pastured

CHEVIOT SHEEP—CHEVY CHASE

by a celebrated breed of sheep admirably adapted for hilly districts, and known in many of the more elevated districts of Great Britain.

Cheviot Sheep, a breed of sheep of large carcass and valuable fleece, which has been pastured from time immemorial on the Cheviot Hills, on the borders of England and Scotland, and from its powers of endurance is justly regarded as the most valuable mountain sheep of Great Britain. The peculiar features of the Cheviots are the absence of horns in both sexes; white or mottled-gray face and legs, an erect, long, and clean head, destitute of wool, while both the throat and neck are well covered, long open ears well covered with hair, and altogether a fine open sprightly countenance, with every indication of hardiness. The fleece weighs from three to four pounds, and the weight of the carcass varies in ewes from 12 to 16, and in wethers from 16 to 20 pounds per quarter. The Cheviots, though originally confined to a small area, are now spread over all parts of the kingdom, and except on the most barren and stony grazings, are far more profitable than the heath breed.

Chevreul, Michel-Eugène, mē-shēl è-zhān shē-vrēl, French chemist: b. Angers 31 Aug. 1786; d. Paris 9 April 1889. He was educated in his native town, and when a youth went to Paris, and was employed in the chemical factory of Vauquelin. In 1813 he became professor of physical science in the Charlemagne Lyceum; in 1824 he was made director of dyeing in the carpet manufactory of the Gobelins; and in 1830 succeeded Vauquelin in the chair of chemistry at the Museum of Natural History. He was the author of 'Lectures on Chemistry Applied to the Art of Dyeing' (1831) and other treatises on chemistry and dyeing, and an important work on the 'Principles of Harmony and Contrast of Colors,' 1839, which has been translated into English. He was a commander of the Legion of Honor, and the centenary of his birth was celebrated in Paris with much enthusiasm.

Chevreuse, chèv-réz, Marie de Rohan Montbazon, mōn-bā-zōn, DUCHESS DE, French political adventuress: b. December 1600; d. Gagny, near Paris, 12 Aug. 1679. When scarcely 17 years old, she married Charles d'Albert, grand constable of France, then a favorite of Louis XIII., who died four years afterward. She next became the wife of Claude de Lorraine, Duke of Chevreuse. A great friend of Anne of Austria, she incurred the hatred of Richelieu, and succeeded so well in making herself obnoxious to him, that he determined to have her arrested; but, made aware of his project, she assumed man's attire, crossed the Somme by swimming, and fled to England. For years she was an exile from France, and King Louis XIII. had been inspired by his minister with such fear of her uncontrollable spirit and cunning, that in his will he forbade her return to France. In spite of this, Anne allowed her to return, without, however, showing her the same degree of confidence as before, and the queen's coldness induced the duchess again to leave the court. Afterward she engaged in new plots against Mazarin, mostly acting in concert with Cardinal de Retz, and was once more compelled to leave France.

Her intriguing spirit outlived her beauty, which had so much contributed to her former successes. She wandered through the Netherlands, Germany, and England, still persisting in plotting against her enemies.

Chevron, shēv'rūn, a bent bar, rafter-shaped, in heraldry. A chevron is, according to some, a third, and, according to others, a fifth of the field. A chevronel is half a chevron, and the couple close the fourth of the shield. A chevron couped is that which does not reach the sides of the escutcheon. A chevron in chief is one which rises to the top of the shield. In architecture a chevron is a zigzag molding, characteristic of Norman work.

Chevrotains, shēv'ró tānz, a family (*Tragulida*) of ungulates, which though ruminant, in the general sense, differ in many respects from true deer; they resemble the true *Cervida* in certain minor peculiarities, and the musk-deer in others; but anatomically they are, in the main, distinct, especially in such of the more important characteristics as make naturalists class them by themselves. The chevrotains are divided into two genera, one African, and the other Asiatic, the latter genus (*Tragulus*) being that of the true chevrotains. These form a group of diminutive, hornless, deerlike animals, standing only about 12 inches high, found in southern India, Ceylon, and the Malayan peninsula. They are usually reddish, tawny, or mouse-grey in color, except the Indian mouse-deer (*Tragulus meminna*), which is flecked with white. The "water-deer" of western Africa is a kindred species, as is also the species found in the Philippines. Wherever found, these animals are sly little creatures, with a peculiarly stiff manner of walking, and given to hiding in thickets and inaccessible crags. They may, however, be readily tamed. They are considered as a survival of the Miocene form to which is also attributed the ancestry of the deer.

Chevy Chase, chēv'ī chās, the name of a celebrated border ballad probably founded on some actual encounter occurring between Percy and Douglas, although the incidents mentioned in it are not historical. It is this ballad that Sir Philip Sydney speaks of when he says, in his 'Defense of Poetry,' "I never heard the old song of Percie and Douglas that I found not my heart moved more than with a trumpet"; and which is made the subject of a critique by Addison in Nos. 70 and 74 of the 'Spectator.' On account of the similarity of the incidents in this ballad to those of 'The Battle of Otterbourne,' the two ballads have often been confounded; but the probability is that if any historical event is celebrated at all in the ballad of Chevy Chase, it is different from that celebrated in 'The Battle of Otterbourne,' and that the similarity is to be explained by supposing that the incidents were borrowed.

There are two versions of the ballad bearing the name of Chevy Chase, an older one and a more modern one. The older version is sometimes called the 'Hunting of the Cheviot,' which is its original title. It begins thus:

"The Persè owt of Northombarlande,
And a vowe to God mayd he,
That he wolde hunte in the mountayns
Off Chyviat within dayes thre,
In the mauger of doughte Dogles,
And all that ever with him be."

CHEW — CHEYENNE

Neither the exact age nor the name of the author of this version is known. From the fact that it is mentioned in the 'Complaynt of Scotland,' written in 1548, where it is called the 'Huntis of the Chevot,' it is clear that it was known in Scotland before that time, and since James of Scotland is mentioned in the ballad, it may be inferred that it was not written before the reign of Henry VI., for James I. did not ascend the throne of Scotland till two years after Henry VI. had become king of England. As for the author, it is true that a manuscript of the ballad contained in the Ashmolean collection at Oxford is subscribed by one Rychard Sheale, but it is likely that this Rychard Sheale was merely one who had frequently recited the ballad, and perhaps the person who committed this old version to paper. This is probably the version with which Sir Philip Sydney was acquainted, since he speaks of it as "evil apparelled in the dust and cobweb of an uncivil age."

The age of the more modern version is no better known than that of the older one, but it is said by Dr. Rimbault to be no later than the reign of Charles II. This is the version which forms the subject of the critique by Addison in the above-mentioned numbers of the 'Spectator.' The following is the opening stanza as given in Percy's 'Reliques':

"God prosper long our noble king,
Our lives and safeties all;
A wofull hunting once there did
In Chevy-Chace befall."

Chew, Benjamin, American jurist: b. 29 Nov. 1722; d. 20 Jan. 1810. He studied law in Philadelphia under Andrew Hamilton, and in London. He began the practice of his profession in Philadelphia in 1745; and held a number of public offices, becoming chief justice of the State in 1774. In 1776 after the adoption of the Declaration of Independence, he took a decided stand against the patriot cause, and was imprisoned at Fredericksburg, Va., because he refused to sign parole. In 1790 he became president of the high court of errors and appeals, a position which he held until the court was abolished in 1806. He lived in Germantown in a large stone house which is still standing and shows the marks of the cannonading it received during the battle of Germantown, when a party of British took refuge there and were fired upon by the American artillery. See **GERMANTOWN, BATTLE OF**.

Chewing-gum, a resinous gum used as a masticatory. The habit of chewing gum is perhaps peculiar to the United States. At first the resinous exudations of the spruce, cherry, etc., were employed in their native state; but with the increase of the habit the spruce supply nearly failed, and recourse was had to other ingredients. Of late years a gum known as chicle (q.v.) has come to the front as the foundation of most of the chewing-gum. The chicle gum is chopped into fine particles, dried, and then cooked in steam-jacketed kettles. At this stage sweetening and flavoring ingredients are added to the mass, which is mixed mechanically. The resulting "dough" is then kneaded on a table and rolled between rollers having knives set into their faces. These knives cut the sheets into suitable sizes for the market, and, after drying, the sticks are wrapped, packed, and shipped.

Chewink'. See **TOWHEE BUNTING**.

Cheyenne, shi-én (Sioux, "red," i. e. foreigners=enemies: their own name="ours"), an important Indian tribe of the great Algonquin stock, and its westernmost member except the Blackfeet. In the 18th century they lived on the Sheyenne River in eastern North Dakota, but were gradually driven southwest by the Sioux to the forks of the Big Cheyenne near the Black Hills, where Lewis and Clark found them in 1803. Originally settled agriculturists, their acquisition of horses turned them, like the other plains Indians, into nomad raiders and led to their foraying even to Mexico, and claiming lands as far apart as the upper Missouri in northern Montana, and the forks of the Platte, though they numbered but little over 3,000. The first United States treaty with them was made in 1825 in the former locality. They had already fraternized with the Sioux; and when their location at the Black Hills grew unsatisfactory, one section (the "Northern Cheyenne") joined the Ogallalla Sioux in driving the Crows from the Powder and Tongue river valleys in southeast Montana, while the remainder (the "Southern Cheyenne") moved south and formed a confederacy with their Algonquin kinsmen, the Arapaho, on the Arkansas. In 1851 a treaty was made with the Northern band at Fort Laramie, on the North Platte, to cut roads through their lands. A number of treaties were made with the Southern, but it is alleged that the commissioners neither made them intelligible nor executed them fairly; the Cheyenne, with their Indian allies, committed the usual atrocities which were their one method of retaliation; the settlers clamored for their extermination; the military desired to cow them by heavy punishments; the Indian department blamed both and wished peace. The Indian commissioner in 1864 sent some 400 Cheyenne and Arapaho to a camp at Sand Creek, Col.; Col. Chivington fell upon them 29 November (see **SAND CREEK MASSACRE**), and butchered 131 men, women, and children. A bloody and costly war followed; the next year the tribe consented to go upon a reservation, except a band called the "Dog Soldiers," who held out. In 1867 Hancock burned their village at Pawnee Fork, and another war with them began. On 27 Nov 1871, Custer inflicted a crushing defeat upon them at the Washita in Indian Territory, killing Black Kettle, their chief, and compelling them to return to their reservation. The Northern band all this time remained peaceful, despite urgent solicitations from their brethren and the Sioux. Fresh treaties were made in 1866 and 1868. In 1900 the Northern Cheyenne numbered 1,357, on a reservation in the Tongue River valley, Custer County, Mont., and were increasing. The Southern Cheyenne are united with the Arapaho, in Oklahoma; their reservation was on the Canadian River, near El Reno, but was opened up in 1892. They number about 2,100, and are governed by a council of five chiefs. The Cheyenne are a tall, finely built race, the best physically of all the plains Indians except the Osages; but rather dull intellectually. Their language is one of the most difficult even of Indian tongues.

Cheyenne, Wyo., city and capital of the State, and county-seat of Laramie County; on the Union Pacific, Denver & Gulf, and Burling-

CHEYNE — CHI-LI

ton Route R.R.'s, 150 miles north of Denver. Cheyenne is situated on a plateau 6,075 feet above the sea and contains Fort Russell, a United States military post, and the main repair shops of the Union P. R.R. It has a fine State House, waterworks, electric lights, a public library, high school, and two national banks, and is the great beef growing centre, the shipping point for beef-cattle to eastern markets, and the supply depot for a large amount of the trade of the Rocky Mountain region. Pop. (1900) 14,087.

Cheyne, chān, George, Scotch physician: b. Methlick, Aberdeenshire, 1671; d. Bath, England, 13 April 1743. He started a London practice in 1702, in which year he was elected a Fellow of the Royal Society. Full living made him enormously fat, as well as asthmatic, but from a strict adherence to a milk and vegetable diet he derived so much benefit that he recommended it in all the later of his dozen medical treatises, which included 'A New Theory of Fevers' (1701); 'Philosophical Principles of Natural Religion' (1705); 'Essay of Health and Long Life' (1725); and the 'English Malady, a Treatise on Nervous Disorders' (1733).

Cheyne, Thomas Kelly, English biblical scholar: b. London 18 Sept. 1841. He was educated at Merchant Taylors' School, Worcester College, Oxford, and Gottingen. In 1868 he was elected Fellow of Balliol College, from 1880 till 1885 he was rector of Tendring in Essex. In the latter year he was appointed to the Oriel professorship of the interpretation of Scripture at Oxford, also becoming canon of Rochester. He edited the Old Testament portion of the Variorum Bible for Messrs. Eyre and Spottiswoode, and in 1884 became a member of the Old Testament Revision Company. His numerous works deal exclusively with the exposition and criticism of the Old Testament books. They include: 'Notes and Criticisms on the Hebrew Text of Isaiah' (1868); 'The Book of Isaiah Chronologically Arranged' (1870); 'The Prophecies of Isaiah' (1880-1, new ed. 1884); 'The Book of Psalms Translated' (1884); 'Job and Solomon' (1887); 'The Book of Psalms or Praises of Israel' (1888); 'Jeremiah: his Life and Times' (1888); 'The Hallowing of Criticism' (1888); 'The Origin and Religious Contents of the Psalter' (1891); 'Founders of Old Testament Criticism' (1893); 'Introduction to the Book of Isaiah' (1895); 'Religious Thought and Life Among the Hebrews' (1898); 'Isaiah, Critically Revised' (1897-9); 'The Christian Use of the Psalms' (1899). He has also written many articles on similar subjects in various periodicals, and is joint editor of the 'Encyclopædia Biblica.' Canon Cheyne's works reveal a scholarly and able attempt to reconcile the views of the advanced critics of the Bible with those belonging to the evangelical school.

Cheyne, William Watson, English surgeon. He was educated at Edinburgh University and was Hunterian professor of the Royal College of Surgeons of England, 1888-90. He has published: 'Antiseptic Surgery: its Principles, Practice, History, and Results' (1882); 'Manual of the Antiseptic Treatment of

Wounds' (1885); and other important professional works.

Chézy, Antoine Léonard de, ʼān twān lā-ō-nār dē shā-zē, French Orientalist: b. Neuilly, France, 15 Jan. 1773; d. there 31 Aug. 1832. He began his studies in the École Polytechnique, and afterward attended the lectures of Andran, Caussin, and Silvestre de Sacy, on Oriental literature. Unassisted, he taught himself Sanskrit, and became such a proficient in it that, in 1814, a chair of Sanskrit was formed expressly for him in the College of France. Among his productions is a free French translation of the Persian poem, Medjnoun and Leila. He also published Kālidasa's drama of Sakuntala, in the original, with a translation accompanied with notes (Paris 1830).

Chézy, Wilhelm von, German novelist and historical essayist: b. Paris 21 March 1800; d. Vienna 13 March 1865. He was the son of A. L. Chézy (q.v.). He acquitted himself creditably as a journalist, and wrote many popular tales: 'The Wandering Pupil' (1835); 'The Six Noble Passions' (1842); and 'The Last Janissary' (1853), among them; as well as 'Chivalry in Picture and Word' (1848), a study of much value.

Chézy, Wilhelmine Christiane von Klenck, German poet and novelist: b. Berlin 26 Jan. 1783; d. Geneva, Switzerland, 28 Feb. 1856. She received an excellent education, and was married in her 16th year to a gentleman of the name of Hastfer, from whom she separated about a year after. Madame de Genlis, who had been acquainted with her at Berlin, invited her to Paris, where she shortly afterward became the wife of Antoine Léonard de Chézy (q.v.), but separating from him as from her former husband, she returned to Germany and engaged in various literary pursuits. She has acquired considerable celebrity by her 'Poems' (1812); 'Heart Notes During a Pilgrimage' (1833); and 'Emma's Ordeal' and other novels, but is perhaps best known as the writer of the libretto of Weber's opera of 'Euryanthe.'

Chhatisgarh, chūt-tēs-gār', India, the southeast division of the Central Provinces, with an area, including feudatory states, of 25,013 square miles. It is mainly a vast fertile plateau, and has of late become a great centre of the Indian grain trade. Dongargāon is the capital. Pop. 3,545,000.

Chi-Li, chē-'lě', or **Pe-Chi-Li**, one of the provinces of China proper. It has an area of 57,800 square miles and is bounded north by Mongolia, east by the gulf called Pe-Chi-Li, and the province of Shan-Tung, and west by the province of Shan-Hsi. In the north there are extensive unworked seams of anthracite, and the southern portions of the province are very fertile, the chief productions being cotton, tobacco, and various cereals. Chi-Li is in many respects the most important of the Chinese provinces, containing as it does the imperial capital, Peking, the treaty port of Tien-Tsin, and the only completed line of railway in the empire. The provincial capital is Pao-Ting-Fu, 80 miles from Peking. The Great Wall runs across the whole of the north part of Chi-Li, while on the coast are the forts of Taku, and the nearest approach to a naval station belonging to the Chinese government. The province is mountainous and traversed by important rivers,

notably the Pei-Ho, the Lan, the Ho-Kien, and the Hu-to. The Yu-Ho is especially important because of its canal system. The climate is at times severe, the Pei-Ho being generally frozen over from December to March. There are Christian missionaries of many denominations throughout the province. The Belgians, the Italians, the English, and the American China Development Company hold important concessions in the province. There is a good system of telegraph lines. The exports are principally bristles, feathers, wool, skins, etc. The railway system open for traffic in 1900 was 290 miles in length, 79 miles from Peking to Tien-Tsin, 27 miles from Tien-Tsin to Tang-Kou (near Taku), 144 miles from Tang-Kou to Shan-hai-Kwan, a point where the Great Wall touches the sea, and an extension of 40 miles beyond toward Manchuria. No census has been taken since 1879 when the population was returned as 17,937,000. In 1900 the population was estimated at 25,000,000, including a large Manchu element. See CHINA.

Chiabrera, Gabriello, ga-brē-ē'lō kē-ā-brā'ra, Italian lyric poet: b. Savona 8 June 1552; d. Savona 14 Oct. 1637. Impatient of dependence on the great, he again and again abandoned the courts of noble patrons. He visited Rome, and resided a considerable time at Florence and Genoa, settling finally in his native place. Wherever he went he was loaded with presents and honors. Pindar and Anacreon were his models among the poets, and his countrymen named him "the Italian Pindar," but his Pindaric odes have little grace and force, being labored rather than spontaneous. Some of his little songs after Anacreon are models of elegance and grace. He wrote epic and dramatic poems also. He left a charming autobiographical sketch. His collected poems were published under the title of 'Rime.'

Chian (kī'ān) **Turpentine**, a greenish-yellow, non-acrid turpentine or resin obtained mainly from the island of Chios (Scio), yielded by *Pistachia terebinthus*, of the order *Anacardiaceae*, a large tree, native to the Mediterranean islands and shores. The turpentine, now used only in medicine, exudes from the tree in small quantities during the warmer months, but it is obtained at other seasons by making incisions in the bark. It is called also Cyprus turpentine.

Chiana, kē-ā'nā (the ancient *Clanis*), a river of central Italy, originally a tributary of the Tiber, watering a perfectly level valley, which its overflow rendered once the most pestilential district of Italy. The bed was deepened in 1789-1816, and in 1823 extensive hydraulic works were undertaken for further improving the river course, and for leading a north branch, through canals, to the river Arno, a few miles below Arezzo, the south stream reaching the Tiber through the Paglia at Orvieto. The double stream is 60 miles long, and one half to one mile broad; and the district has since become one of the most fruitful in all Italy.

Chianti, kē-ān'tī, a district in Italy, near Siena, where what is now the best-known red wine of Italy is produced. Chianti wine is full flavored and astringent, with an alcoholic strength of about 20 per cent.

Chiapas, chē-ā'pas, a state of the republic of Mexico, on the Pacific slope, having an

area of 27,111 square miles. The capital is Tuxtla-Gutiérrez. The state is in many parts mountainous, and is also in many parts traversed by fine streams, including the Rio Chiapas. At Palenque are the ruins of an ancient Aztec city of great beauty and magnitude. The valleys have a rich soil and produce maize, sugar, cotton, etc. There is a considerable export of logwood. Trade is, however, in a backward state for lack of roads. Education is free and compulsory, but the law is not strictly enforced. The state forms part of the Central American tableland, and has a fine climate, although the whole region is largely clothed in primeval forests. Pop. 364,000.

Chiari, Pietro, pē-ā'rō kē-ā'rē, Italian novelist and comedian: b. Brescia 1700; d. Brescia 1788. After completing his studies he entered the order of Jesuits, but soon changed the monastic for the secular life, and devoted himself solely to letters. He resided at Venice, with the title of poet to the Duke of Modena, and in the space of 10 or 12 years brought more than 60 comedies on the stage. Chiari and Goldoni were rivals, but the public adjudged the palm to the latter. Chiari's dramas in verse fill 10 volumes; those in prose, four.

Chiari (known to the Romans as **CLARIUM**), Italy, a town in Lombardy, 14 miles west of Brescia. It is well built, has several churches, two convents, an elementary school, a hospital, and a public library. It was formerly fortified, and some of its ancient defenses still exist. It has manufactures of silk, linen, and cotton, and some tanneries. Prince Eugene here defeated the French and Spanish troops, 1 Sept. 1701. Pop. 11,000.

Chiarini, Giuseppe, joo-sēp'pē kē-ā-rē'nē, Italian poet and critic: b. Arezzo 17 Aug. 1833. He is a student of foreign literatures, especially English and German, and has been editor of literary journals. His verse is mostly lyrical, and has been collected under the titles: 'Poems' (1874); 'In Memoriam' (1875); 'Lacrymæ' (1879); etc. It gives proof of deep poetic sensibility. He has translated some of Heine's poems, and has published critical essays on English and German poets.

Chiaroscuro, kē-ā-rōs-kū'rō, or **Chiaro-oscuro**, kē-a-rō- (It. *chiaro*, "clear"; *oscuro*, "obscure"), in painting the art of judiciously distributing the lights and shadows in a picture. A composition, however, perfect in other respects, becomes a picture only by means of the chiaroscuro, which gives faithfulness to the representation, and therefore is of the highest importance for the painter; at the same time it is one of the most difficult branches of an artist's study, because of the want of precise rules for its execution. Every art has a point where rules fail, and genius only can direct. This point in the art of painting is the chiaroscuro. The drawing of a piece may be perfectly correct, the coloring may be brilliant and true, and yet the whole picture remain cold and hard. This we find often the case with the ancient painters before Raphael; and it is one of the great merits of this sublime artist that he left his masters far behind him in chiaroscuro, though he is considered not so perfect in this branch as Correggio and Titian, who were inferior to him in many other respects. The

CHIASTOLITE — CHICAGO

mode in which the light and shade are distributed on any single object is easily shown by lines supposed to be drawn from the source of the light which is shed over the figure; but *chiaroscuro* comprehends, besides this, aerial perspective, and the proportional force of colors, by which objects are made to advance or recede from the eye, produce a mutual effect, and form a united and beautiful whole. *Chiaroscuro* requires great delicacy of conception and skill in execution; and excellence in this branch of art is to be attained only by the study of nature and of the best masters. *Chiaroscuro* is also understood in another sense, paintings in *chiaroscuro* being such as are painted in light and shade and reflexes only, without any other color than the local one of the object, as representations of sculpture in stone or marble. There are some fine pieces of this sort in the Vatican, at Rome, by Polidoro da Caravaggio, and on the ceiling of the Paris Bourse by Meynier and Abel de Pujol.

Chiastolite, *ki-as'to-lit*, a variety of the mineral andalusite, occurring in stout crystals of prismatic aspect, and distinguished by containing carbonaceous impurities that are distributed through the interior according to a geometric scheme, so that a section of the crystal presents a tessellated appearance or shows a distinct cross. Also called "macle." The name "chiastolite" is derived from a Greek word signifying "arranged diagonally."

Chiavari, *kē-ā-vā'rē*, Italy, a seaport in the compartimento of Liguria, province of Genoa, on the Gulf of Rapallo, 23 miles southeast of Genoa. It has all the appearance of an old Italian town, consisting of narrow streets lined with substantial houses and open arcades. Silks, lace, etc., are manufactured, and fishing and trading are carried on. Pop. 13,000.

Chiavenna, *kē-ā-vēn'nā*, Italy, a town on the Mera 38 miles north-northwest of Bergamo, in the province of Sondrio, Lombardy. It stands in a valley in the midst of magnificent scenery on the road to the Splügen, and at the junction of two passes through the Alps, and has an important transit trade. Pop. (1901) 4,788.

Chibchas, *chēb'chās*, or **Muyscas**, a tribe of South American Indians who formerly lived east of the Magdalena River, occupying the region from its head waters to the Sierra Nevada de Merida. They were partially civilized and excelled in weaving and pottery making, were skilful goldsmiths and also followed agriculture to a considerable extent. They were ruled by women as well as men in the line of succession, and believed in a Supreme Being, although they worshipped the sun and stars. The Chibchas were conquered in a war with the Spaniards in 1537 and their descendants, who have intermarried with Europeans constitute a large part of the present population of Colombia.

Chibouque, *chī-book'*, a long Turkish pipe having generally a wooden stem, an amber mouth-piece, and a clay bowl.

Chica, or **Chicha**, *chē'chā*, a South American word having several meanings.

1. A species of *Sterculia*, the seeds of which are eaten in Brazil. They are about the size of a pigeon's egg, and have an agreeable taste.

2. A red coloring matter prepared by the Indians on the upper parts of the Orinoco and the Rio Negro from the leaves of a plant native to that region called *Bignonia chica*, and with which they paint their skin, in order to be better able to resist the rays of the sun. It is of a beautiful vermilion color, and, although of a resinous nature, is not liable to become liquid under the influence of heat. It is soluble in alcohol, and stains cotton orange-yellow. It is extracted by boiling the leaves in water, decanting the decoction, and allowing it to settle and cool when a red matter falls down, which is formed into cakes and dried. It is also called *carajuru*.

3. A dance popular among Spanish South Americans. It is said to have been introduced into Spain by the Moors, and to have been the origin of the fandango, which some writers declare to be the *chica* under a more decent form. It is similar in character to the dance of the Angrismene performed at the festivals of Venus, and still popular among the modern Greeks.

Chica, *chē'kā*, **Pito**, *pē'tō*, or **Po'so**, a kind of beer made from maize, in general use in Chile, Peru, and other mountainous regions of South America. It was the national drink of the natives long before the appearance of the Spaniards. The most ordinary method of preparing it is to steep the grains of maize until they begin to sprout, when they are exposed to the sun. The malt thus prepared is then ground, mixed with warm water, and left to ferment. The beer, when ready, has a dark-yellow color and a pleasant and somewhat bitter and sour taste. It is consumed by the Indians in great quantities. In the valleys of the north the Indians chew the malt instead of grinding it. It is then mixed with warm water and other ingredients and allowed to ferment as before. In a short time the beer is ready. When it has been buried for some time in the earth in pitchers it has a violently intoxicating effect. This kind of *chica* is called *chica mascada*, and is said to be much preferred by good judges to the ordinary sort.

Chicacole, *chīk-a kōl'*, or **Cicacole**, India, a town in the Ganjam district, Madras Presidency, near the coast, about 567 miles north-east of Madras, notable for its fine muslin manufactures. On two occasions, namely in 1791 and 1866, it suffered much from famine, and in 1876 a flood did considerable damage to the town. Pop. 18,241.

Chicago, Ill., the second city in the Union, is in Cook County, and lies on the southwestern shore of Lake Michigan. The dome of the court-house is in north latitude $41^{\circ} 53' 6.2''$, and longitude $87^{\circ} 36' 1.2''$ west. The city has a shore line on the lake of 26 miles, and extends 10 miles inland. The city area, 190,638 square miles, covers a great part of the alluvial plain formed by the Chicago and Calumet rivers. The Chicago River is formed by the junction of two small rivers, the north and south branches, thus dividing the city into three portions commonly known as the North, South, and West sides, respectively. Calumet River is the outlet by which the shallow sheet of water known as Calumet Lake empties into Lake Michigan. The land on which the

CHICAGO

city is built is level and lies quite low, the elevation above Lake Michigan being only 25 feet. The two rivers form natural harbors, which have been improved by dredging. The shore of Lake Michigan is broken by few bays or inlets, and harbors are infrequent, and, as a rule, not commodious. Wherever, therefore, a river is found, navigators eagerly use it, so far as its depth permits, as a refuge from the storms of the great lake.

Early History.—In the early days of French exploration it was found that the Indians used the Chicago River as one line of travel by which the Mississippi could be reached. Passing up the river and its south branch, a portage of only four or five miles brought the traveler to the Desplaines River, down which his canoe passed to the Illinois River, and so to the Mississippi. This route seems to have been used by white men for the first time in 1673, when Joliet and Marquette, returning from the Illinois River, were shown by the Indians the Chicago portage. It may be that they descended to Lake Michigan by the Calumet. Père Marquette spent the winter of 1674-5 in a cabin on the south branch of the Chicago River, being unable on account of physical weakness to prosecute his journey to the Illinois villages. It was in the following springtime that the devoted missionary died, while endeavoring to make his way to Mackinac by the east shore of Lake Michigan.

The French seem later to have had a fort at the Chicago portage, although it was probably a mere stockade, and no regular garrison was kept in it. This fort is mentioned by James Logan in his report to the governor of Pennsylvania in 1718, and also in the treaty of Greenville, 1795. However, the Chicago portage was not much used by the French, as they found other routes of travel safer and more convenient.

About the time of the Revolutionary War a colored man from San Domingo, Jean Baptiste Point de Sable (or au Sable), made his way to the Chicago River and established himself there as an Indian trader. Here, about 1777, he built a house of squared logs which may be regarded as the beginning of continuous settlement at Chicago. This house he sold in 1796 to a French trader, who in turn sold it in 1803 to John Kinzie, the first American settler. The house, known as the old Kinzie mansion, stood on the north bank of the river opposite the site on which Fort Dearborn was later built, and was in existence until 1837.

Kinzie was an Indian trader, and no doubt thought the Chicago a convenient centre for his business. He brought his family to his new home in 1804, the same year in which the fort was built, and thereafter continued his residence there until his death (1828).

Fort Dearborn was a mere stockade, with two blockhouses. The quarters for the garrison were enclosed in the stockade. It was situated on the south bank of the river, not far from the lake. At that time the river took a sharp turn to the south just east of the fort, and made its way into the lake over a heavy sandbar not far from what is now the eastern end of Madison Street. The bar was not capable of being crossed by anything larger than a small boat, and the schooner which, in 1804, brought the stores for the garrison had to anchor and

land passengers and cargo in boats. The first garrison consisted of one company of infantry (of the First regiment). The site of the fort was on a reservation of six square miles, set aside from the United States in Wayne's treaty with the Indians made at Greenville in 1795.

The settlement at Fort Dearborn made little growth until after the War of 1812. It was far in the wilderness, being reached from Detroit by a trail through the woods, and from Mackinac by lake schooners of which usually two came each year, in spring and fall.

The Massacre of 1812.—In 1812 the second war with Great Britain broke out, and at the outset in the northwest all the advantage lay with the British and their Indian allies. Mackinac was captured, thus securing to the British the control of the upper lakes, and Gen. Hull, in command at Detroit, sent orders that Fort Dearborn should be evacuated, and that the surplus stores should be divided among the Indians. These orders were executed, and on 15 August the garrison, escorting a number of women and children, set out for Detroit by the road which wound along the lake shore. At a point among the sand hills near the eastern end of the present Eighteenth Street the savages attacked in force, and the whole body of whites were captured or destroyed. Two of the women and twelve children were butchered during the fight, and a number of the wounded men were killed afterward. The Indians then burned the fort and divided the plunder.

In 1816, after peace was fully restored, Fort Dearborn was reconstructed on a somewhat larger scale than before, and under protection of its garrison a small village slowly grew up.

Political Jurisdictions.—In the old days of French and British occupation the territory, including the valleys of the Wabash and Illinois rivers, west to the Mississippi and north to Lake Michigan, was commonly known as the "Illinois Country." The main French settlements were at Vincennes, on the Wabash, at Kaskaskia on the river of that name, and at Cahokia and Fort Chartres, on the Mississippi. In 1763, by the Treaty of Paris, the French government yielded to Great Britain all claim to land east of the Mississippi, and thus the Illinois Country became British. By the "Quebec Act" of 1774—one of the legislative acts of the British government which led to the Revolutionary War—all of the newly acquired land between the Ohio and the Great Lakes was included in the province of Quebec, thus placing it under the arbitrary military government at that time prevailing over Canada.

In 1778 a small army of Virginia troops sent out by Gov. Patrick Henry, under command of Col. George Rogers Clark, seized Kaskaskia and Vincennes, and thus replaced British authority by American throughout the Illinois Country. The treaty of peace of 1783 drew the northern line of the new republic through the Great Lakes, instead of through the Ohio River, as doubtless would have been done had it not been for Clark's victorious expedition, and thus the site of Chicago became finally American and not British. Virginia organized the Illinois Country as a county—the County of Illinois—and under that government it continued from 1778 until the cession of all the northwest by Virginia to the United States, in 1783.

CHICAGO

While Clark's expedition determined the exclusion of British authority from the Illinois Country, there remained a dispute as to jurisdiction over it among several of the States. Virginia claimed all the territory between the Ohio, the Mississippi and the lakes, on the ground mainly of conquest. New York claimed the same territory, on the ground of a treaty with the Iroquois, who were asserted to have extended their conquests as far as the Mississippi. Massachusetts and Connecticut claimed, under their original charters, to own all the land between their northern and southern boundary lines of latitude west of New York as far as the Mississippi. Under these various claims Chicago is in territory claimed respectively by Virginia, New York, and Connecticut. The conflicts were settled by acts of cession on the part of the various States to the United States.

After the Virginia act of cession of 1783, the authority of that State was withdrawn from the Illinois Country, and for several years the French villagers were a law unto themselves. In 1787, however, the ordinance for the government of the Northwest Territory was enacted by Congress, and thus the Chicago area came legally into that territory. In 1790 Gov. St. Clair visited Kaskaskia and formed St. Clair County from the southwestern portion of the Illinois Country. The wilderness north of that had practically no white population, and hence no local government was needed. In 1796, however, the County of Wayne was organized, which included Detroit and the Chicago area. It was in this year that the British finally withdrew their garrisons from Detroit, and the new county was named from the victor over the Indians in the campaign of 1794, who also made the Treaty of Greenville in 1795. In 1800 the Indian Territory was organized, in which all the Illinois Country was included, and in 1809 the Illinois Territory was created, including all west of the Wabash River and north to British America. When the boundaries of Wayne County were changed, in 1803, the Chicago area was left out, and it was not included within any county until 1812, when the county of Madison was formed. Under the law of the Territory of Illinois, Chicago was included in Edwards County in 1814, and in Crawford County in 1816. In 1818 Illinois was admitted to the Union as a State. Under the laws of the State Chicago was successively included in Clark County, organized in 1819; in Pike County, 1821; in Fulton County, 1823; in Peoria County, 1825; and finally in Cook County, organized 15 Jan. 1831.

The ordinance of 1787 seemed to indicate that a State in the northern part of the Northwest Territory west of Lake Michigan should have as its southern boundary a line drawn east and west through the southern extremity of that lake, and the bill for the admission of Illinois was originally drawn accordingly. Mr. Nathaniel Pope, delegate in Congress from the territory, however, succeeded in having the bill amended so as to secure the present northern boundary for Illinois. Had this not been done, Chicago would be in the State of Wisconsin.

Origin of the City.—In 1830 Chicago was a hamlet of log houses inhabited by something less than a hundred people. These log houses were nearly all on the North and West sides. The beginning of the city as a prosperous town was due to the Illinois and Michigan canal,

authorized by act of Congress in 1827. By this act the State was granted alternate sections of land on both sides of the canal route, and the canal commissioners proceeded to lay out towns and sell lots in order to secure funds. One of these towns was Chicago, at the eastern terminus of the canal, and the lands platted therein were sold in 1830. The town was bounded on the east by State Street, on the north by Kinzie Street, on the west by Desplaines Street, and on the south by Madison Street. Buildings began to be erected and slowly immigration began to come. The early settlement of Illinois had been in its southern counties and was derived mostly from southern States. The new migration, beginning with 1830, came in the main by way of the lakes and was largely from the East, New York and New England being especially represented. In 1833 Congress made an appropriation for a harbor at Chicago. Piers were built out into the lake, a channel was cut through the old sandbar, and the spring freshets sufficed to scour it out. It was in 1834 that, for the first time, a schooner sailed up the river. By 1837 the town had grown to have a population of 4,170, and in that year it was incorporated as a city.

Railroads.—The canal, from which so much was expected, did not prove the wonderful success that was hoped. It was not finished till 1848. Meanwhile, however, railroad construction began and effectively opened up the prairie interior of the State, while the application of steam to navigation made it comparatively easy to transport passengers and freight between Chicago and Buffalo. In 1852 the Michigan Southern and the Michigan Central railways reached Chicago, and others speedily followed in all directions.

Population and Area.—The growth of the new city in population, slow at first, finally became very great. The area was extended also by successive annexations of contiguous territory. The 4,170 people of 1837 became 4,479 in 1840, 28,269 in 1850, 109,206 in 1860, 306,605 in 1870, 503,298 in 1880, 1,105,540 in 1890, and 1,698,575 in 1900. The city area in 1837 was 2.55 square miles. In 1900 the area was 190.638 square miles.

The Great Fire of 1871.—The year 1871 was memorable for the great fire which swept a large part of Chicago from the earth. Beginning at a little before nine o'clock on Sunday evening, 8 October, in a small barn on the West Side, the flames spread through all the three sections of the city, and were not finally extinguished until Monday night, 9 October, at ten o'clock, when a welcome rain fell. The main business and residence portion of the city was devastated. The total area of the burnt district was 2,024 acres, nearly three and a third square miles, and the value of the property destroyed was estimated at \$187,000,000. The loss of life can only be conjectured—perhaps it amounted to 300 persons. The destitution which for a time fell upon the city was relieved with lavish generosity from all parts of this country and of Europe.

This appalling disaster did not daunt the people of Chicago. They began at once to rebuild the city and to reconstruct business. While many insurance companies were obliged to suspend, still some \$46,000,000 were realized from this source, and fortunately the bank vaults in every instance but one were found to have preserved their contents intact. Within two

CHICAGO

years the burnt area was again covered with buildings, and of a more solid type than before the fire.

The Columbian Exposition.—In 1892-3 a World's Fair was held in Chicago, to commemorate the discovery of America four centuries before. An act of Congress, passed in the spring of 1890, authorized an international exposition in Chicago as an illustration of the development of the new world which Columbus found, made appropriations for the share of the United States government, and provided for a national commission to supervise the work. In Chicago a corporation was formed under the laws of Illinois, to undertake the practical details. Funds were provided from private subscriptions to the stock of the exposition company, from a loan of \$5,000,000 made by the city, the proceeds of which were devoted to the exposition, from a special appropriation by Congress, from gate receipts, and from various concessions. The site was Jackson Park and the Midway Plaisance, an area of 666 acres being included, with a frontage of two miles on Lake Michigan. Buildings were erected on an elaborate scale, and with taste which met wide approval. The great building devoted to manufactures had a ground area of nearly 31 acres, and a floor and gallery space of 44 acres. In the central hall 75,000 people could be seated, while the entire building would seat 300,000. The standing army of Russia might have been drawn up under its roof. The entire cost of the fair was estimated at upward of \$43,000,000. The number of paid admissions throughout the six months from May to November was 21,500,000, the whole number of admissions being 27,529,401.

Chicago and the Federal Government.—In Chicago are held United States courts as follows: The Circuit Court of Appeals, and the Circuit Court of the seventh judicial circuit, and the District Court of the northern district of Illinois. Pending the erection of the new United States federal building, now nearing completion, the courts are held in leased rooms.

The Chicago post-office includes the central office, 47 carrier stations, 4 stations without carriers, and 200 sub-stations. There are 1,633 clerks in the main office and stations, and 1,400 carriers and collectors. The receipts for the year 1902 were \$9,175,895.88. During the same period the pieces of mail handled numbered 457,382,116 first-class, and 216,901,206 second-class, of 49,090 tons weight.

By the apportionment under the census of 1900 Illinois has 25 representatives in Congress. Six of the Illinois congressional districts lie wholly in Chicago, and four more are partly in Chicago.

The port of Chicago showed vessels entered for the year 1902, to be 8,083, with a tonnage of 7,179,053, while the number cleared for the same period was 8,164, with a tonnage of 7,229,342. The receipts of the Chicago custom-house for 1902 were \$6,339,889.45. The internal revenue collections for the same period were \$8,876,909.33.

Chicago and the Government of Illinois.—The General Assembly of the State of Illinois numbers 51 senators and 153 representatives, one senator and three representatives being elected from each district. Of these districts 14 are wholly and 4 are partly in the city of Chicago.

The Supreme Court of Illinois consists of seven judges elected one in each of seven districts for a term of nine years. Chicago is in the seventh judicial district. The five counties composing that district had in 1900 a total population of 2,013,353, of which Chicago had 1,698,575.

Cook County forms a judicial circuit of the State, and has (in 1903) a Superior Court of 12 members and a Circuit Court of 14 members. These courts have concurrent jurisdiction in law and equity. The members are elected for a term of six years by the voters of the county. The population of Cook County in 1900 was 1,838,735, of whom 1,698,575 were in Chicago.

Three judges of the above courts are designated by the Supreme Court of the State to sit as an appellate court, with appellate jurisdiction over the circuit, superior, and county courts. In like manner three other judges are designated by the same authority to form a branch appellate court.

The Criminal Court of Cook County is formed by judges of the Circuit and Superior courts, who alternate in the duty of holding such court. Cook County also has a County Court and a Probate Court, each consisting of one judge, elected by the people of the county, for a term of four years. All these courts sit in the city of Chicago.

As has been noted, Chicago contains 1,698,575 of the 1,838,735 people of Cook County, or 92.4 per cent. The taxable value of property in Cook County, which, by State law, is one fifth of the assessed full real value, is \$433,487,627. The taxable value of property in Chicago is \$402,482,319, or 92.8 per cent of that of the county. Moreover, many of the people residing in Cook County outside the limits of Chicago, have their business in the city. From these facts it is plain that Cook County is largely identical with Chicago.

The affairs of the county are administered by a county board of 15 members, elected for a term of three years. Ten are elected in the city and five from that part of the county outside the city. The president of the board is designated by the people at the election for commissioners.

The administrative officers of the county are a treasurer, clerk, sheriff, coroner, recorder, superintendent of schools, State's attorney, county attorney, a civil service commission, a jury commission, a board of assessors, a board of review, and some other officials of minor functions. The county maintains an insane asylum and poor-house, and a county hospital (the last-named being in the city). As the city has no hospital, except one for contagious diseases, the county hospital practically takes the place. Chicago is the county-seat, and hence all the county officials above named have their offices in the city. The administrative officers are in the main elective.

The City Government.—The city is incorporated under the general laws of the State for municipal corporations. The constitution of Illinois forbids special charters for corporations, and the statutes provide in detail a scheme of government for cities.

Local legislation and general administrative oversight are vested in the common council. Each of the 35 wards elects two members, for a

CHICAGO

term of two years. One half of the council are chosen each spring. The mayor presides over the council.

The mayor is the administrative head of the city. He is chosen by popular election, also for a term of two years. He has the veto power over all acts of the council, and exerts directive control over the administrative departments. The mayor appoints the heads of departments, subject to the approval of the council. Heads of departments appoint their subordinates, subject to the approval of the mayor. The city treasurer, city clerk, and city attorney are elected by the people. The main administrative departments are those of finance, law, public works, police, fire, health, and education. The departments of health and education are under boards. The others have a single head.

The city budget is made annually by the common council, and the same body levies a tax to meet a great part of the expenses. Water rates provide the cost of water supply, and there is a considerable income from licenses. The sanitary board and the three park boards are permitted by law to levy taxes for their own purposes.

The board of education forms, strictly speaking, a department of the city government. The 21 members are appointed by the mayor, subject to the approval of the common council. Seven are appointed each year for a term of three years. The board, with the common council, levies an annual tax on city property. Such tax may not exceed two per cent on the assessed value of property. The city school tax for the year 1902 yielded \$7,397,860.60. Besides this the city school fund received during the same year \$331,833.86 from the State, \$512,596.41 from interest on investments, and \$82,455.94 from miscellaneous sources. The total income of the school board for 1892 amounted to \$8,395,791.06.

The public schools offer free education through all grades up to and through the high schools, and the law makes elementary education compulsory. There are 15 high schools, with 356 teachers and an enrollment of 10,920 pupils. There are 235 elementary schools, with 5,021 teachers and 257,472 pupils. Students finishing the high school course are prepared to enter college. There is also a city normal school, with 74 teachers and 521 students, and there are 327 special teachers. The grounds, buildings, and equipments of the schools represent an investment of \$34,474,311.33.

The Park System.—The parks of Chicago are under control of three boards, one for each of the three sections of the city. These boards are created under State law, and they are independent of the city government. The members of the Lincoln Park Board, on the North Side, and those of the West Park Board, are appointed by the governor of the State. The members of the South Park Board are appointed by the judges within Cook County. Each park board levies taxes on the property within its park district. The park system forms a girdle around the city, from Lincoln Park, on the lake shore at the north, to Jackson Park, on the lake shore at the south. The various parks are connected by a series of boulevards. The total area of parks and boulevards is 2,111.494 acres (1902). On the lake front between Randolph and Twelfth streets a park is being formed by

filling in the submerged land to a distance of 1,200 feet from the existing shore line. This will result in a lakeside park of 203 acres, which is to contain the Field Columbian Museum, as well as the Art Gallery of the Chicago Art Institute. The shore line of this park will be a mile and a quarter. Funds for the parks are obtained by taxes levied by the boards on their respective districts, and by the sale of a limited amount of bonds. By a statute of 1903 park loans to the amount of \$5,000,000 were authorized, and in consequence the total park area will presently be doubled.

The Chicago Sanitary District.—The Chicago Sanitary District was authorized by act of the State legislature in 1889, ratified by vote of the people in the same year, and organized in 1890. The water supply of the city is taken from the lake, being pumped into the mains from a series of stations at varying distances from the shore. The city drainage also was of necessity carried into the lake, either directly or by way of the river. Contamination of the water supply it was hoped to avoid by carrying the pumping stations farther into the lake than it was supposed the sewage outflow would go without purification by air and sun. As the city grew, however, it became manifest that the lake water was dangerous to health, and in the end the plan was devised of cutting a canal between the south branch of the Chicago River and the Desplaines River, with a pumping plant capable of turning the water of the south branch into the canal. Then, by connecting all the sewers with the river, it was intended to convert the city drainage into the Desplaines. As all parts of the city could not be included in the new drainage area, and also as a great part of that area must be outside the city limits, a drainage district was created, known as the Chicago Sanitary District. The construction and management of the canal within that district was entrusted to a board of nine commissioners, elected by the people. Funds were provided by bonds of the district and by taxation. The bonds amount to \$14,005,000. The total cost of the work has been nearly \$40,000,000. Earth was broken 3 Sept. 1892, and the water of the lake was turned into the canal 2 Jan 1900. Since that date it may be noted that the Chicago River no longer flows into Lake Michigan. Its waters now reach the Mississippi. The Sanitary District as originally created comprised all of Chicago north of Eighty-seventh Street, and some 43 square miles of Cook County outside of Chicago. The assessed value of taxable property in the district is \$393,080,042, of which \$387,204,282 belong to that portion within the city—a percentage of 98.5. By law the board was authorized to effect loans to the amount of five per cent of the value of the taxable property in the district, provided that the total should not exceed \$15,000,000. The tax levy of the district must not exceed one half of one per cent of the assessed value of taxable property in the district.

By a statute of 1903 large additions of territory will be made to the Sanitary District, so as to protect the lake water both north and south of the original area.

The main channel of the canal, from river to river, is 28.5 miles long. The width on the bottom varies from 110 feet to 202 feet, and on the top from 198 feet to 290 feet. The mini-

mum depth of water is 22 feet. It is evident that in the drainage canal is the beginning of a navigable waterway from Lake Michigan to the Mississippi River—including, indeed perhaps two thirds of the work and cost of such waterway.

Public Works.—The city department of public works has charge of the paving, repair, and cleaning of streets and alleys, of the construction and maintenance of sewers, and of the city waterworks. There were in the city 31 Dec. 1902, 2,798.34 miles of streets and 1,375 miles of alleys—a total of 4,173.34 miles. Of these 1,373.01 miles were paved. This is exclusive of the parkways and boulevards under the care of the various park boards, in which there are 101.250 miles of improved driveways. The total mileage of sewers, 1 Jan. 1903, was 1,527.05. Intercepting sewers are now under process of construction for the purpose of diverting the flow of sewage from the lake into the drainage canal.

The pumping stations provided the city during the year 1902 with 130,892,288,020 gallons of water. The mileage of water pipe in use was 1,918.74. Water rates were collected to the amount of \$3,225,317.43—an amount sufficient to cover the cost of the supply.

The City Library.—The Chicago Public Library contains 282,925 volumes. The main library building, on Michigan Avenue between Randolph and Washington streets, is valued at \$2,055,550. The income of the Library Board (the members of which are appointed by the mayor), was for 1902, \$284,008.08. Of this sum \$273,696.69 were derived from taxation, and the remainder from miscellaneous sources. The library maintains branch reading rooms and delivery stations in different parts of the city. The T. B. Blackstone Memorial Branch Library, an Ionic building of granite and marble, with shelving capacity for 25,000 books, is nearing completion, the gift to the city of Mrs. T. B. Blackstone.

The City Corporate.—The city corporate, that is, the city exclusive of the Sanitary and Park corporations and the school board, had a total public revenue for 1902 of \$11,055,391.78. Of this sum \$5,770,876.97 were derived from taxation, \$3,770,735.37 from licenses. The public debt of the city corporate was 31 Dec. 1902, \$15,123,000. There were also at that time outstanding water certificates to the amount of \$1,000,000.

Institutions of Private Endowment.—The public spirit of Chicago citizens is manifest in many institutions endowed by private munificence for the public good.

The Chicago Art Institute is devoted to maintaining an art gallery and to conducting education in art and architecture. The enrollment of students for 1902-3 was 2,580. The Ryerson Library of Art, a beautiful wing of the main building, contains about 3,000 volumes.

The Newberry Library, on the North Side, has an endowment of \$2,500,000, and occupies a building valued at \$500,000. The library, used wholly for consultation, has 260,773 books and pamphlets.

The John Crerar Library, on the South Side, has an endowment of \$3,400,000. The books, which are confined to branches of science, number 89,210.

The library of the Chicago Law Institute, Vol. 4—38

which has quarters in the County Court-house, numbers 39,830 volumes.

The library of the University of Chicago contains 365,000 volumes.

Higher education is represented by the University of Chicago, by the professional schools of Northwestern University, by the medical schools of the University of Illinois, by the Armour Institute and the Lewis Institute, and by various independent schools of law and medicine.

The University of Chicago (q.v.) opened its doors for instruction in 1892. The buildings are situated on the South Side, fronting on the Midway Plaisance, one of the south parkways. Its assets amount to \$17,348,000. The enrollment of students in 1902-3 numbered 4,463. The university consists of colleges of arts, literature, and science, a divinity school, a law school, a medical school, a professional school for teachers, and of various other activities, including a press department, which publishes both books and periodicals.

Northwestern University maintains in the city its schools of law, medicine, pharmacy, and dentistry. The college of liberal arts and the school of music are at Evanston. The entire endowment of the university, including grounds and buildings, amounts to \$6,000,000. The total number of students in all departments (1902-3) was 2,731.

The University of Illinois (located at Urbana, Champaign County) has its schools of medicine, dentistry, and pharmacy in Chicago. There were in 1902-3 in these schools 1,039 students.

The Lewis Institute is a polytechnic school, on the West Side. It was opened for instruction in 1895, the endowment at that time amounting to \$1,600,000. The enrollment of students for 1902-3 included 1,143 in the day classes and 1,362 in the night classes.

The Armour Institute, on the South Side, is also a polytechnic school. The endowment amounts to \$4,500,000, and the enrollment of students, 1902-3, was 1,300.

The Field Columbian Museum (q.v.) is an outcome of the Exposition of 1893. The museum was incorporated in that year, and was at the outset enriched by many of the most valuable exhibits which had been made at the Exposition. The original endowment of \$1,250,000 was the gift in large part of one citizen. Large acquisitions have been made, especially in the fields of American ethnology. The collections are at present housed in one of the remaining Exposition buildings, in Jackson Park. Plans are on foot for more adequate provision in the near future. In 1900-1 there were 4,196 students enrolled in the schools of law, medicine, and theology situated in Chicago.

There are 52 hospitals in the city, including the Cook County hospital. Many of these are liberally endowed. There are also 33 free medical dispensaries, 59 asylums, including the Cook County Insane Asylum and the county poor-house, both of which are situated at Dunning, outside the city limits.

Churches.—Religious organizations number some 919 churches and missions. Of these the most numerous are the 70 churches and 14 missions of the Baptists, the 79 churches and 20 missions of the Congregationalists, the 47 churches and 6 missions of the Episcopalians,

CHICAGO — CHICKAHOMINY

the 34 Jewish congregations, the 93 Methodist Episcopal, 69 Lutheran, 56 German Protestant, and 135 Roman Catholic.

Business.—Manufactures and commerce form the basis of Chicago's prosperity. With the development of the West and the extension of railroads the industries of the city have grown to enormous magnitude. The manufactures of iron and steel in South Chicago, the agricultural implement works, and the beef and pork packing, are among the largest. The receipts of live cattle at the Union Stock Yards in 1902 were 2,941,559, of sheep 4,515,716, and of hogs 7,895,238. By far the greater part of these were either consumed in the city or packed and sold abroad. The Chicago elevator warehouses have a capacity of 30,470,000 bushels of grain. The total clearings of the associated banks of Chicago for 1902 were \$8,394,872,351.59, and the total balances were \$653,199,396.54. The national banks in the city had (25 Nov. 1902) a total capital stock of \$24,900,000, and total deposits of \$265,136,636. State banks showed (22 Dec. 1902) total deposits of \$215,413,008.

The census of 1900 records 19,203 manufacturing establishments Chicago, with a capital of \$534,000,689, an average number of 262,621 wage earners, total wages amounting to \$131,065,337, and a product valued at \$888,945,311. New York by the same census shows 39,776 establishments, with a capital of \$921,876,081, and a product of \$1,371,358,468. The third manufacturing city in the Union is Philadelphia, with 15,887 establishments, a capital of \$476,529,407, and a product valued at \$603,466,526.

HARRY PRATT JUDSON.

Chicago, The, a ship of the U. S. navy, launched 5 Dec. 1885; put out of commission 1 May 1895; remodeled and made into a protected cruiser in 1898. The Chicago was used as a flagship by Admiral John G. Walker until 1895, and visited many foreign countries, among them the shores of the Mediterranean, Brazil, the Argentine Republic, Venezuela, and the principal European ports. The ship originally could make but 14 knots an hour; but with her new engines has increased her speed 5 knots an hour. Her new battery consists of four 8-inch rifles, and 14 rapid-fire 5-inch rifles, with a secondary force of seven 6-pounders, two 1-pounders, two Colts, and one 3-inch field-piece. In time of war the Chicago is intended to serve as a scout, a commerce-destroyer, and a blockader. In 1900-1 she was the flagship of Rear-Admiral Schley's South Atlantic squadron.

Chicago Drainage Canal, a canal intended chiefly for carrying off the sewage of Chicago, but which may be used for commercial purposes. It was begun in September 1892, and was completed in January 1900. The main channel is

29 miles long, extending from Chicago to Lockport on the Illinois River, into which stream it discharges. The cost of the canal was about \$45,000,000. See CANALS.

Chicago University. See UNIVERSITY OF CHICAGO.

Chichen, chī-chān', or Chichen-Itza, ē-tzā', Mexico, an ancient ruined city of Yucatan, 18 miles southwest of Valladolid. Its magnificent ruins have a greater appearance of antiquity and are in better preservation than most of the other ruined cities of the same province, which has received much attention from archæologists on account of its remains of a little known people in a state of considerable civilization. Here have been studied the most interesting and important remains of the Mayan tribe of Itza. Among the ruins of the ancient city is a pyramid 550 feet square at the base; a vast building, supposed to be a temple, with bas-reliefs; houses containing sculptured chambers; and many other structures of archæological interest.

Chichester, chich'ēs-tēr, England, a municipal borough and episcopal city, near the southwest corner of the county of Sussex. It is well built and has wide streets. Its old wall, still in good preservation and lined with lofty elms, gives it a very picturesque appearance. Its principal edifice is the cathedral, an ancient Gothic structure, with one of the most graceful spires in England, and containing among many monuments one of the poet Collins, who was born and died here. The fine old octagonal market-cross should also be mentioned. Pop. (1901) 12,241.

Chick-pea, the popular name of *Cicer arietinum* and other plants of the same genus, growing wild along the shores of the Mediterranean and in many parts of the East, and producing a short puffy pod with one or generally two small wrinkled seeds. It is an important article of French and Spanish cookery, and the plant is cultivated in Europe, Egypt, Syria, India, Mexico, etc. When roasted it is the common parched pulse of the East. It is sometimes used as a substitute for, or as an adulterant of coffee. The herbage serves as fodder for cattle. The chick-peas are leguminous plants of the vetch tribe, differing from the vetches mainly in the fruit. Seven species are known, having the flowers solitary or in small axillary groups.

Chick'-a-dee (an onomatopoeic word, imitating the note of the bird), a local name for the black-cap titmouse. See TITMOUSE.

Chickahom'iny, a river in Virginia, about 75 miles in length. It is an affluent of the James and runs parallel to it for many miles from its source northwest of Richmond. As its course was between the Union armies and Richmond, on and near it occurred many of the most important events of McClellan's Peninsula campaign in 1862, including the battles of Williamsburg, Hanover Court-House, Fair Oaks, Mechanicsville, Cold Harbor, Savage's Station, Frazier's Farm, and Malvern Hill (qq.v.). The second battle of Cold Harbor under Grant occurred 3 June 1864.

CHICKAMAUGA

Chickamauga, *chik-a-mâ'ga*, **Battle of**, fought near Chickamauga Creek, and on Georgia soil, 19-20 Sept. 1863. Gen. Rosecrans (q.v.) having forced Bragg (q.v.) out of his fortified position in Middle Tennessee by a campaign of strategy, prepared to gain possession of Chattanooga, the gateway through the mountains to the Gulf States, and a most important railroad centre for the Confederacy. Bragg held the city, which was beyond the Cumberland Mountains and the Tennessee River. Rosecrans' army lay along the western base of the Cumberlands. His headquarters were at Winchester, Tenn. His army was composed of three corps of infantry, the Fourteenth, Gen. George H. Thomas; the Twentieth, Gen. Alex. McD. McCook; and the Twenty-first, Gen. Thomas L. Crittenden. Gen. D. S. Stanley commanded the one corps of cavalry. McCook's corps was the right wing. Thomas'

ley to the river, crossed both that and the Sand Mountains, and entered Lookout Valley near the north point of Lookout Mountain. A reconnoitering party, 9 September, discovered the evacuation of the city. Passing around the point of the mountain, Crittenden, leaving one brigade in the city, proceeded at once by way of Rossville Gap to operate to the left of Thomas, who had descended Lookout at Stevens' Gap. McCook was further to the right, having crossed Lookout at Winston's. The grand strategy of the campaign had been entirely successful. The army had been thrown over three formidable mountain ranges and a wide river, all within the immediate territory of Gen. Bragg, without opposition, almost without discovery, and entirely without loss. To possess Chattanooga it remained necessary to concentrate the widely separated corps in it, or between it and Bragg.

Erroneous dispatches led Rosecrans to believe that Bragg was retreating on Rome. He ordered pursuit, and found Bragg occupying the gaps in Pigeon Mountain in force and preparing movements against each separate corps. These failed, and Bragg, having notice of the arrival of Longstreet, with two divisions from the Army of Northern Virginia, issued, 18 September, orders of battle designed for interposing between the Union army and the city. At this time the main bodies of the two armies confronted each other across the upper Chickamauga, and Longstreet was arriving at Ringgold. Crittenden's corps was concentrated at Lee and Gordon's mill.

During the afternoon of the 18th Gen. Bushrod Johnson from Ringgold, in command of five brigades, including Hood's division of Longstreet's corps, forced a crossing at Reed's Bridge, after a sharp defense by Minty's cavalry. Walker's corps, after failing at Alexander's Bridge, which was defended by Wilder's brigade of mounted infantry, crossed at a ford below. During the night about two thirds of Bragg's army crossed the Chickamauga, and early in the morning of the 19th he formed line of battle directly on Crittenden's left flank and in near contact with it. Bragg's plan was to drive Crittenden's corps back on Thomas in the centre, and both on McCook at the right, and force the whole into the mountains. His plan of battle was interfered with and finally destroyed by an undiscovered night advance of Rosecrans' centre and right, by which he passed several miles beyond Bragg's position and thrust his lines across the La Fayette road and eastward to the Chickamauga, and so gained position between Bragg and Chattanooga. The head of Thomas' corps, which struck Forrest's cavalry at Jay's Mill, was Brannan's division. The fighting became desperate and at close quarters, and so continued until 1 o'clock, when Forrest and his supports were repulsed. Soon both armies were rapidly advancing toward this vortex of fierce fighting. It was of desperate character on both sides, continuing from noon until sunset, with alternate success and repulse for each side, the field finally remaining in possession of the Union forces. The deadly fighting throughout the day had been largely in forests thick with underbrush, and so all within the limits of point-blank range. At nightfall Cleburne's division burst with great force upon the lines of

the centre, and Crittenden's the left. Stanley's cavalry guarded the right flank, and Minty's brigade of cavalry the left.

The plan of campaign involved the repair of the railroad to the Tennessee River, the collection of supplies for a month's absence from any base, and ammunition for two battles. It also included throwing Rosecrans' army to the rear of Chattanooga and advancing to it from the south. His centre and right were ascending Lookout before Bragg became aware of the character of the movement. He then evacuated Chattanooga and moved to La Fayette, 26 miles south and behind Pigeon Mountain, the next range east of Lookout, leaving his rear-guard just below Lee and Gordon's Mill at the crossing of the Chickamauga. Crittenden having accomplished his purpose north of the Tennessee, withdrew through Sequatchee Val-

CHICKAMAUGA

Johnson's and Baird's divisions, which were well in advance at the centre. They gradually withdrew from under the fire which continued for an hour after dark. At the close of the fighting for the day Rosecrans' army held the La Fayette road between Bragg and Chattanooga, and Bragg's plan of battle for the day had been effectually defeated.

On the Union side the entire force except five brigades had been engaged. Of Bragg's army three divisions and one brigade present had not been engaged, and two brigades did not arrive until the second day. At the close of the first day's battle the Confederate line extended from Hall's Ford to Jay's Mill. The Union line was brought back nearer to the La Fayette road, which was the axis and the objective of the battle. The Confederate line extended far beyond the Union left. Counting by brigades, the Union line was overlapped on its left by four brigades of cavalry, two fighting dismounted, and two brigades of infantry, and on its right by two brigades of infantry. The Confederates had 15 brigades in their reserves, counting Longstreet's second and third lines, Law's and Kershaw's divisions, at the centre. The Union army had five, an overlapping force for the Confederates of four brigades, and an excess of 10 in the reserves. The Union line had strengthened its front by logs, stumps, stones, and fence rails. Counting by divisions from left to right, it was formed as follows: Baird, Johnson, Palmer, and Reynolds east of the La Fayette road; Brannan, Negley, Davis, Sheridan, and Wilder's Mounted Brigade west of it, with Wood and Van Cleve in reserve. The Confederate line, from right to left, was thus composed: Pegram and Armstrong of Forrest's cavalry, Breckenridge, Cleburne, Stewart, Bushrod Johnson, Hindman, Preston, with Walker, Liddell, Cheatham, Law, and Kershaw in reserve.

The Confederates attacked about 9 o'clock, Breckenridge moving against Baird, the left brigade, striking Baird's rude works, being broken on them and its commander being mortally wounded. The other two brigades swung around full in the Union rear, but were driven back after sharp fighting. Cleburne and Stewart assaulted in succession and were both repulsed. At 11 o'clock Negley, in rear of the Brotherton house, had been replaced by Wood from the reserve, and sent to the left. Brannan, on the left of Wood, had also been ordered to the left, but the Confederate attack developing on his front, he did not move. Upon the supposition that he had gone, Wood was ordered to close on Reynolds, the next division to the left of Brannan. Wood moved promptly to find Reynolds. This left a gap, just as Longstreet, with a column of three divisions, Bushrod Johnson in the front line, Law in the second, and Kershaw in the third, was moving to attack Wood's position. This broke the Union centre. Davis' and Sheridan's divisions to the right of the break were rushed toward the gap, but failed to restore the line, and being attacked in front and on both flanks by Johnson's and Hindman's troops were forced off the field in confusion. Rosecrans, Crittenden, and McCook, being with the right wing, were driven off the field with that portion of the army which left it. Brannan's division, the first on the left of the break, swung back nearly at right angles,

and took position on Snodgrass Hill, a quarter of a mile in the rear, on which also rallied other portions of the Union army that had been scattered or broken. At noon Forrest's cavalry, opposite Cloud's, had crossed the La Fayette road and captured the field hospitals of the Union left wing.

The four divisions of Baird, Johnson, Palmer, and Reynolds maintained their lines around the Kelly field. At 1 o'clock Gen. Thomas had formed parts of Brannan's, Wood's, and Negley's divisions, with various fragments, on Snodgrass Hill. Negley had left at noon with two regiments of infantry and 40 guns. Gen. Thomas then found himself with only one battery. About 1:30 the hill was assaulted by five brigades, that of Fulton overlapping Brannan's right and gaining the valley in his rear. At this juncture Gordon Granger arrived from McAfee's Church with Whitaker and Mitchell's brigades of Steedman's division, and promptly attacking, drove the Confederate force which had crossed the ridge over it again, and extended Gen. Thomas' line for a half mile along the crest. About the same time Van Derveer's strong brigade arrived from its successful charge on Breckenridge in the Kelly field and strengthened Brannan's line. Longstreet's assault continued with little intermission until sundown, all being of the most courageous character. Finally 11 Confederate brigades were participating in the attack on Snodgrass. For its defense Thomas at the last had five brigades and about one half of two others. There was little fighting on the Kelly field line after 1 o'clock, though Bragg ordered a general attack for 3. It was not delivered until about sundown. At 3 Longstreet, from Snodgrass Hill, asked Bragg for re-enforcements, but was informed that the right wing had been so beaten back that it could be of no service to him. Longstreet's last assault was with troops that had not been engaged. Their attack began at 4:30 and lasted until 6. They gained a salient of the Union line and held it for an hour, with a loss of 36 per cent, but were finally dislodged by Gen. Charles H. Grosvenor's regiment.

At 5:30 Gen. Thomas began withdrawing his army. The four divisions on the Kelly field retired in succession from right to left. Reynolds and Palmer were not attacked. The Confederate attack ordered for 3 o'clock was delivered just as Johnson and Baird were leaving their lines, and some captures were made, though both reached the forest west of the La Fayette road without disorganization, and followed the rest of the left wing through McFarland's Gap to Rossville. At 7 o'clock the Snodgrass Hill line began to retire from left to right. Steedman's withdrew at 6, sundown. Fighting in his front had ceased. An hour later Trigg and Kelly, passing over the ground which Steedman had occupied, captured the greater part of three Union regiments which were temporarily attached to the left of his line, and by mistake had not received notice of the withdrawal. The last volley of the battle was fired by troops of Van Derveer's brigade at Kelly's and Trigg's lines, which, after capturing the isolated troops, attempted to move on Van Derveer's position. Davis' division, which had been cut off at noon, reached a point on its return near Gen. Thomas' right at sundown.

CHICKAMAUGA NATIONAL MILITARY PARK — CHICKASAW BAYOU

Gen. Sheridan, who had continued to Rossville, marched toward the field from that point, reaching Cloud's an hour after sundown. Both of these divisions acted as supports for the flanks, while the troops were being withdrawn. Gen. Thomas withdrew the army without molestation through McFarland's Gap to Rossville, and during the night placed it in strong position in the gap at Rossville, along the adjacent crests of Missionary Ridge, and across the valley to Lookout Mountain. It was thus firmly established between Bragg and Chattanooga. Holding his lines through the next day, at night he withdrew toward Chattanooga.

Gen. Rosecrans crossed the Tennessee with an effective force of a little above 55,000. Two brigades and an additional regiment were detached. A maximum figure for his force at the opening of the battle would be 50,000. It is difficult to approximate Bragg's force. A week after the battle he reported 38,846 effectives, and his losses to have been 18,000, which would make his force in action 55,846. Gen. R. E. Lee, writing to President Davis of Bragg's strength, five days before the battle, said: "His total effective force will therefore be 76,219, as large a number as I suppose he can operate with." This was counting Longstreet's re-enforcement, according to Gen. Lee's figures, but a large part of Longstreet's forces never reached Bragg. In view of Gen. Lee's statements, and the known overlapping of the Union lines, and the preponderance of his reserves, it would seem that Bragg's force can be fairly fixed at 55,000.

Few, if any, of the great battles of the war show an equal percentage of casualties, considering the numbers engaged and the time of fighting. The losses for killed and wounded and missing for Rosecrans were 16,179, and for Bragg 18,000. For the troops actually engaged these figures give a percentage of 33 per cent for each side. On the Confederate side, Longstreet's wing lost 44 per cent, nearly all on the second day. Bushrod Johnson's division lost 44 per cent, and Preston's 33 per cent in the attack of an hour and a half on Snodgrass Hill; and Gracie's brigade of the latter division lost 36 per cent during the same time. The brigade losses in Cheatham's division ranged from 35 to 50 per cent. The loss in Breckinridge's division was 33 per cent, and in Cleburne's 43 per cent. Bates' brigade of Stewart's division lost 52 per cent. The Confederates assaulted throughout the second day.

On the Union side Steedman's division lost 49 per cent in four hours, and all of these were killed or wounded but one. Brannan's division lost slightly over 36 per cent; Van Derveer's brigade of that division only two less than 50 per cent; Davis' division a little over 50 per cent; Van Cleve's division 23.5 per cent. Among the Union brigades Buell's loss was 45 per cent, Carlin's 53 per cent, Hazen's 34 per cent, Dick's 25 per cent, Connell's 37 per cent, and Croxton's 39 per cent.

On 22 September Bragg began to establish his lines before Chattanooga and prepare for either driving or starving the Union army out of it. Consult 'War of the Rebellion Records,' Vol. 23, parts 1 and 2; Vol. 30, parts 1, 2, 3, and 4.

H. V. BOYNTON.

Chickamauga National Military Park. Congress, in 1890, passed an act authorizing the establishment of a park on the site of the battle of Chickamauga. In carrying out the project the States of Georgia and Tennessee co-operated with the commission appointed by Congress. To the United States Federal government the citizens of each State sold and the States ceded jurisdiction over lands and roads included in or leading to the battle-field of Chickamauga, as well as the sites of those actions which took place about Chattanooga, and which the park also commemorates. The actual area of the park is 11 square miles, but to all intents and purposes it embraces a much larger tract. It was dedicated with elaborate ceremonies 19-21 Sept. 1895, and already it has been greatly beautified, and markers, monuments, etc., furnishing explanations of the field, have been erected. See BOYNTON, HENRY V.

Chick'aree, the American red squirrel; a popular name, imitative of its cry. See SQUIRREL.

Chickasaw Bayou, or Bluffs, Battle of. On 8 Dec. 1862 Gen. Grant ordered Gen. W. T. Sherman to organize at Memphis, Tenn., an expedition which, in co-operation with Admiral D. D. Porter's gunboat fleet, should reduce Vicksburg. On the 22d the expedition rendezvoused at Friar's Point on the Mississippi, ready to move up the Yazoo River in rear of Vicksburg. Sherman had the four divisions of Gens. F. Steele, Geo. W. Morgan, M. L. Smith, and A. J. Smith, aggregating about 30,000 men. The transports, preceded by the gunboats, entered Yazoo River on the 25th, and on the 26th and 27th the troops were landed on its south bank, confronting the bluffs overlooking the swamps through which ran Chickasaw Bayou. Gen. J. C. Pemberton, commanding the Confederate forces in Mississippi, was at Grenada opposing Grant, who was moving south from Grand Junction and Corinth on the line of the railroads. On the 21st Pemberton heard that the fleet and transports were moving down the Mississippi for the supposed purpose of attacking Vicksburg, which at the time was held by Gen. Martin L. Smith with the brigade of Gen. S. D. Lee. Vaughn's brigade was immediately ordered to Vicksburg, and was soon followed by the brigades of Gregg and Barton. Pemberton arrived at Vicksburg on the 26th and the last of the three brigades during the night of the 27th. Pemberton disposed his forces, Vaughn, Gregg, Barton, and Lee, on a line from Vicksburg on the left to Haynes' Bluff on the right, a distance of 13 miles, on high ground overlooking Chickasaw Bayou and the Yazoo River. S. D. Lee holding Walnut Hills from Vicksburg to Snyder's Mill on the right, a distance of 10 miles. Lee was a good engineer and a fine officer; he strengthened his position by works for his batteries and rifle-pits on the slope of the bluff, which rose to an elevation of about 200 feet above the bayou. Between this position and where Sherman had landed was bottom land, almost wholly densely wooded, intersected with bayous and low, swampy ground. There were but three roads through this area, and these were obstructed by earthworks and felled timber. By these roads Sherman advanced on the morning of the 27th, Steele on the left, Morgan on the right of Steele, and

CHICKASAW

M. L. Smith and A. J. Smith on the right of Morgan. There was heavy skirmishing on the 27th and 28th, the Confederate outposts were driven in, and at night of the 28th the Union troops lay parallel to Chickasaw or Walnut Hills bluff and about 600 yards from its foot. The main assault on the bluff was to be made by Morgan, supported by Steele; while, to make a diversion in favor of Morgan, A. J. Smith, with M. L. Smith's division and one brigade of his own, was to cross a lake, a mile below Morgan, by a narrow sand-bar, and attack. On the extreme right the rest of A. J. Smith's division was to demonstrate on the road to Vicksburg. On the morning of the 29th Morgan represented to Sherman that an attack from his position was impracticable; but Sherman, after an examination, made no change in his disposition, and rode off to his headquarters, whence he sent his adjutant-general to Morgan with this message: "Tell Morgan to give the signal for assault; that we will lose 5,000 men before we take Vicksburg, and may as well lose them here as anywhere else." Morgan replied that Sherman's entire army could not carry the position in his front, but that he would order the assault. De Courcy's brigade of Morgan's division, and the two brigades of Blair and Thayer of Steele's, were formed for the assault. The signal was given by a heavy artillery fire upon the Confederate lines, and at 12 o'clock the three brigades went forward. By some misunderstanding Thayer's brigade, with the exception of the 4th Iowa, diverged too far to the right, but De Courcy, Blair, and Thayer (with the 4th Iowa), about 6,000 men, after clearing the obstruction in front and floundering through deep mire and tangled marsh, under a terrific fire of artillery, finally made a lodgment on the hard table-land at the foot of the bluff, where an abandoned line of works gave shelter, and where some of the men stopped. All formation was broken up, brigades and regiments mixed, but on went the main body, pushed up the bluff, and reached different points of Lee's works, but were met on both flanks by such a withering fire from the rifle-pits that ran diagonally up the slope of the hill, and so severe a cross-fire of shell and canister from the batteries, that the men faltered and, no support being in sight, fell back to the point of starting, leaving about 1,500 killed, wounded, and captured. Lee lost 115. More to the right, where A. J. Smith was to demonstrate, the 6th Missouri gained the levee at the foot of the bluff, but not able to go farther under the hot fire poured upon them from above, the men sought shelter by digging with hands and bayonets into the bank of the levee, where they remained until night covered their withdrawal, after a loss of 57 killed and wounded. Sherman thought of renewing the assault in the morning, but after a personal examination he came to the conclusion that the enemy's centre could not be broken without crippling his army beyond the power to act with any vigor afterward, and proposed to attack Haynes' Bluff, higher up the Yazoo. Preparations were made to assault at 4 o'clock on the morning of 1 Jan. 1863. Admiral Porter, who was to co-operate in this attack, found the fog so dense on the river that he could not move his boats. The attack was deferred and then abandoned, and by sunrise, 2 January, the troops were all re-embarked on transports and sailed

for Milliken's Bend. The Union loss in the assault on Chickasaw Bluffs and in the skirmishing preceding it was 1,213 killed and wounded, and 563 missing. The Confederate loss was 177 killed and wounded, and 10 missing. Consult: 'Official Records,' Vol. XVII.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.; F. V. Greene, 'The Mississippi.'

E. A. CARMAN.

Chickasaw, *chik'a-sâ*, the most active and warlike tribe of the great Muskhogean (q.v.) Indian stock; a branch of the Choctaw (q.v.), and according to their own tradition, not separated till after the united tribe crossed the Mississippi eastward. They occupied north-eastern Mississippi, and the adjacent part of western Tennessee to the Ohio. Their chief settlements were on the head-waters of the Tombigbee and Yazoo, about the present Pontotoc and Chickasaw counties, and a trail led to them from the site of Memphis, 160 miles off, their principal Mississippi landing. They were first found by De Soto, who reached the village of "Chicaça," with 200 houses, on the west bank of the Yazoo, 17 Dec. 1540, and remained there till March; but when he undertook to impress some of the Indians as porters, he was repeatedly assailed, the village fired, his path barred by a stockade, and he lost many men before he beat them off. English traders penetrated thither in the 17th century. After the French settlement at Mobile, the rivalry of the two nations first set them against the French, and for a time cut off the Mississippi trade from both; but with the French, as the only real colonists in that region, they were in constant and envenomed hostility for many years, and Bienville and D'Artaugette led expeditions against them again and again, not even a nominal peace in 1740 putting an end to their warfare. With Oglethorpe of Georgia they had friendly relations. At this time they had four large contiguous settlements, with the houses in each scattered over a space 1 to 2 miles wide and 4 to 10 long; the chief was called Chookka Pharaah, or Long House. Their sachem was called the *mico*. In 1765 Gov. Johnstone of west Florida induced them and the Choctaws to hold a council with him at Mobile, where a trade tariff was framed; but the white traders among them soon precipitated fresh troubles. After the Revolution, at the great general treaty of Hopewell, 28 Nov. 1785, their *mico* Pto and others made a treaty delimiting their lands from the Ohio River to the Mississippi State line. Their number was then estimated at 800 to 1,200. The reliability of these estimates may be judged from the fact that they are said to have had 10,000 warriors when they crossed the Mississippi, 450 in 1755, 750 in 1764, and 500 in 1768. In 1793 they joined the whites against the Creeks, and continued friendly to the settlers. In 1805, 1816, and 1818, they gradually ceded all lands north of the Mississippi line. About 1800, as the hunting grounds narrowed, the tribe began to migrate west of the Mississippi, as did the Cherokees and others. In 1822 there were in Mississippi 3,625 on a reliable count, with eight towns, and a progressive civilization: they were industrious farmers and cattle-men, marketing live stock among the whites. By the treaty of Pontotoc Creek, 20 Oct. 1822, they made another large cession of

CHICKEN — CHICKEN-SNAKE

lands; and by that of Washington, 24 May 1834, they gave up all the remainder, the two cessions comprising 6,442,400 acres, or over 10,000 square miles, for which they received \$3,646,000. On 17 Jan. 1837 they bought of the Choctaws for \$530,000 a district on the Red River west and south of the Washita (the extreme western part of the present Indian Territory), to be inalienable except with the consent of the Choctaws; relinquished their governmental organization, and became a part of that nation, with proportionate representation in its government. A considerable number, instead of remaining with the tribe, scattered through the Choctaws, buying and taking up lands at pleasure. They lagged behind the Choctaws in progress, however; a smallpox epidemic carried off several hundred; the government annuity made them lazy; and they opened no schools till 1851. Aggrieved at being represented in the Choctaw government only according to numbers, instead of equally as a tribe, they appealed to the President, and on 27 June 1855 were given separate title to their district as the Chickasaw Nation. They organized a government with a council and two-chambered legislature, and advanced rapidly. In the Civil War, as slaveholders, and having southern agents, they joined the Confederate side; lost about one fourth of their people, and were liable to the penalties of treason. By the treaty of Fort Smith, September 1865 they were conditionally restored to their rights. On 28 April 1866 all the old treaties were renewed; but they were forced to sell to the government 7,000,000 acres of land, nearly 11,000 square miles, for \$315,000, the money to go to their former slaves unless they admitted them to full tribal citizenship. They held off for some years, but finally acceded on 10 Jan. 1873. The "nation" in 1900 numbered 5,872, of whom probably two thirds were Chickasaws proper, and they are increasing.

Chicken. See FOWL.

Chicken-flea, the common name of *Sarcophylla gallinacea*, a pest of young chickens in tropical and subtropical regions, and destructive from Florida to Texas. It is smaller and shorter than the cat flea, with the eyes and antennæ in the hinder part of the head, and it does not hop. It abounds mostly in shady places, under old houses, and in earthen floors. It is first observed to infest young chickens and turkeys, and by its number and pertinacity kills young chickens, while being more or less permanently parasites on hens. Consult: Packard, 'Insect Life,' Vol. VII.

Chicken-lice, several species of bird-lice (*Mallophaga*), or louse-like wingless insects, afflicting chickens and hens. Unlike the louse (*Pediculus*), which obtains its nourishment by suction, the bird-lice have free jaws adapted for cutting feathers, though they also draw blood from the skin of their host. The large chicken louse (*Goniocotes abdominalis*) is less common than the lesser chicken-louse (*G. hologaster*); it is only one millimetre long, while the first-named kind is three millimetres long. Quite a different kind is the common hen-louse (*Menopon palidum*), which is the most abundant and annoying of all. It differs from the others in its light color and greater activity, running among the feathers and from them upon the hands of

persons handling fowls. It is from one to one and a half millimetres long, rather slender, and of a pale straw-yellow color. Fowls should be allowed plenty of ashes and road dust in which to roll. An infested henry should be well fumigated and whitewashed, and insect-powder should be dusted upon the birds themselves.

Chicken-mite, or **Poultry-tick**, a small mite (*Dermanyssus gallinae*) which gathers on fowls at night and sucks their blood. It is about one millimeter high, light gray, with dark patches, but red when gorged with blood. It swarms in cracks and corners of the henhouse, and should not be confounded with the bird-tick (*D. avium*).

Chicken-pox, an acute, specific, infectious disease, characterized by a definite incubation period, an eruption of successive crops of vesicles which persist for a certain length of time, and a well-marked clinical course of short duration. It is one of the mildest of the eruptive fevers. The disease is usually epidemic, but sporadic cases do occur. It very frequently accompanies small-pox, and great care must be exercised not to confound mild cases of small-pox with severe cases of chicken-pox. The stage of incubation is usually about eight days, although it may vary from 8 to 18 days. The child may be feverish in some cases, have a slight chill, pain in the back and legs, nausea and vomiting. The eruption usually develops within 24 hours after the first onset. There are first raised red papules which in a few hours are transferred into raised hemispherical vesicles filled with clear serum. At the end of 36 to 48 hours, this clear serum may become purulent, and the vesicles then begin to shrivel, and in from three to four days are changed to dark-brown crusts which fall off and rarely leave a scar. Fresh groups occur during the first two or three days of the illness; as a rule they are not very many in number. In delicate children the number may be large, and gangrene may set in unless great care is taken in the treatment of the vesicles. Chicken-pox is very contagious, but is not dangerous, and the first treatment should be the complete isolation of the patient.

Chicken-snake, a name given in the northern United States to the *Coluber eximius*, *C. quadrivittatus*, or *Ophibolus eximius*. The head is short and the snout rounded; the nostrils are lateral, the eyes large, with a dusky pupil and gray iris; the neck is contracted, the body long but robust, covered with smooth, small, hexagonal scales above, and broad plates below; the tail is short, thick, soon becoming cylindrical, and ending in a horny tip. The color is milky white above, sometimes tinged with red; along the vertebral line is a series of dusky oval spots bordered with black, sometimes giving the appearance of transverse white and black bands. Alternating with these bands on the sides is another series of smaller rounded and blacker spots, and sometimes a third smaller series lower down. The upper lip is milky white; the abdomen is silver white, sometimes yellowish, each plate marked with one or two black, quadrilateral spots, near the centre if single, and near the margins if double, giving a tessellated appearance. It grows to the length of five feet. It is perfectly harmless; from its frequenting houses and dairies it has been called 'house

CHICKEN-TICK — CHICORY

snake" and "milk snake." It feeds on frogs, toads, mice, insects, and small birds. It does not appear to be found below lat. 37° N.; westward it extends to the Mississippi. It prefers shady and rocky places. The chicken snake of the south is *Scotophis quadrivittatus*; the body is very long; above, a greenish clay color, with four longitudinal brown bands; yellowish beneath; scales on the back ridged; and on the sides smooth; the head is quite distinct; the tail is one fifth the whole length; body three and a half feet, and tail 10 inches. It is said to attain a length of seven feet. It is found from North Carolina southward, and to the Mississippi; it destroys rats, young chickens, and small animals, but its bite is harmless to man. It is sometimes found on trees.

Chicken-tick, an arachnid of the family *Argasidæ*, and related to the mites, but very much larger. Originally an inhabitant of tropical America, this tick (*Argas miniatus*) has been found to annoy poultry in Texas and Florida. It is about a quarter of an inch long, usually very flat, unless gorged with blood. The surface of the body differs from that of other ticks in having scattered pits with a raised edge; it also differs from ordinary ticks in the head being covered by the body, in the spiracles being placed between the third and fourth pairs of legs, and in having no pulvillum between the claws. It was originally found in Texas among ordinary ticks taken from cattle. The young is six-footed. Of 10 other species of *Argas*, *A. reflexus* of the Old World lives on pigeons and occasionally attacks man; the Persian *Argas* (*A. persicus*) in Persia attacks man and poultry.

Chick'ering, Jonas, American piano maker: b. New Ipswich, N. H., 5 April 1797; d. Boston, Mass., 8 Dec. 1853. The son of a blacksmith, he received only a common school education, and in 1819 entered a piano manufactory in Boston, Mass., conducted by John Osborn, later going into business for himself. At that time the making of a piano was an event of sufficient importance to receive extended public mention, and the first instruments made by Chickering and his contemporaries were works of art. Before his death his Boston factory was turning out 2,000 pianos a year. The firm has been carried on continuously by his sons, and their pianos have a high reputation among musicians everywhere. Some of the most important developments in pianoforte construction have first been introduced in the Chickering piano.

Chick'weed (*Alsino media*), an annual plant abounding throughout the world in ill cultivated or neglected places. It is botanically related to the corn-cockle or *Agrostemma*, belonging, like it, to the natural order of the *Caryophyllacæ*. It grows in waste places throughout North America, and may be used when young as a substitute for spinach and other greens.

Chiclana, chē-klā'nā, Spain, a town in Andalusia, 12 miles southeast of Cadiz. It stands in a plain on both sides of the Lirio, and about a mile northeast of Barrosa, famous for the defeat of the French, under Marshal Victor, by the British under Gen. Graham, in 1811. It consists of well built houses of hewn stone, white as snow, and generally enclosed by gardens. The principal buildings are a magnificent

hospital, two parish churches, and a large and well-decorated theatre. The manufactures consist of linen, starch, earthenware, and other articles, and there is a considerable trade in corn, wine, and fruit. The baths of Chiclana, which have a temperature of 60°, and are said to be very efficacious in cutaneous affections, are much frequented. Pop. 12,348.

Chiclayo, chē-klā'yō, Peru, a city in the northwest on the coast, is near a valuable sugar district, and the shipping of the sugar is its chief occupation. Pop. 14,000.

Chicle-gum, chēkl- or chē'klā-, an elastic gum produced by the bully-tree, naseberry, or sapodilla (*Achras sapota*), a native of South America. It is largely imported into the United States for the purpose of being manufactured into chewing-gum.

Chico (chē'kō) **Series**, the Upper Cretaceous rocks that originally extended in a broad belt from Lower California northward beyond the Queen Charlotte Islands, and covered the region of the Coast and Cascade ranges. The lower portion of the Chico beds comprises sandstones and conglomerates chiefly, and is from 900 to 1,400 feet thick. The upper portion is mostly shale with some sandstone. The greatest thickness of the whole series in Tehama county, Cal., is nearly 4,000 feet. On Vancouver Island the Nanaimo beds of Chico age contain valuable seams of coal. The fossils show a fauna related to that of southern Asia rather than to the interior American continent. See CRETACEOUS SYSTEM.

Chic'opee, Mass., city in Hampden County, on the Connecticut River, at the mouth of the Chicopee, four miles north of Springfield, and on the Boston & Albany, and Boston & Maine R.R.'s. It is connected with Holyoke and Springfield by electric street railway lines. The former villages of Chicopee Falls, Willamamsett, and Fairview are now included in Chicopee city, which has manufactures of cotton, artillery, bronze, bicycles, rifles, swords, paper, etc. Manufacturing power is furnished by the Chicopee River. It contains numerous churches, public and parish schools, national and savings banks. Pop. (1900) 19,167.

Chicopee River, rises in Worcester County, Mass., flows south southwest into Connecticut River. It has an abundance of water power which is utilized for manufacturing by the numerous towns on its banks.

Chic'ory, or **Succory**, a perennial herb (*Cichorium intybus*) of the natural order *Compositæ*. It is a native of Europe which has become naturalized in many parts of the world, having escaped from gardens in which it is often grown as a pot-herb and salad, or for its roots, which, while young, are used like carrots. In many places it has become troublesome as a weed. The plant may be cultivated like other root crops upon rich, deep, well-drained soil. It resembles dandelion in its leaves, but the perennial roots send up a branched flower-stem which bears leaves of various shapes and flowers of various colors, blue predominating, but pink and white not being uncommon. Besides the use of the root leaves in a green state for salads and as a boiled vegetable, the roots are made to produce two important salads,

witloof and *barbe de capucin*. For these they are dug late in autumn and trimmed of their leaves and superfluous branching roots, and buried in sand or soil in a dark cellar. For witloof, or white leaf, they are stood in a vertical position and covered with several inches of fresh manure or tanbark packed hard; for *barbe de capucin*, they are laid horizontally in pyramidal heaps, a layer of soil and one of roots alternating. In both cases the soil is moistened and the temperature kept uniform. In two or three weeks small heads form in the first case, and long white leaves in the second. Chicory is much more widely grown for its roots, which are used as a substitute for and an adulterant of coffee. The roots are dug, washed, sliced, dried in kilns, roasted in coffee-roasters, ground, and marketed in bulk, in packages, and in sticks. Among the foreign-born population chicory is largely used as a beverage, and since American fields do not supply the demand it is imported from Europe, where the use originated during Napoleon's time. As an adulterant chicory is far less used than is popularly supposed. Its presence may be easily detected by placing a little of the suspected article in a glass of water. Chicory will soon sink and stain the water brown; coffee will float for a long time and then scarcely discolor the water.

Chicoutime, shē-koo-te-mē, Dominion of Canada, county of the Quebec province, formed from Saguenay in 1853. Several smaller sheets of water are scattered over its surface, and the Saguenay intersects it, receiving in its course several small tributaries. The surface is rocky, rough, and broken, but near the streams are fertile and cultivated strips. A great deal of lumber is cut and sawed on the small streams emptying into the Saguenay. The Hudson Bay company have several stations in the county. Capital, Chicoutimi. Pop. 23,760.

Chief Justice, the title of the presiding justice of the supreme court of the United States, and of the presiding justice of the several State supreme courts. Various other courts in the United States are also presided over by a chief justice. The following is a list of the persons appointed as chief justice of the supreme court of the United States from its establishment, some of whom, however, being rejected by the Senate, or, declining the position, never served:

John Jay, of New York, appointed by Washington 26 Sept. 1789; resigned 1791.

John Rutledge, of South Carolina, appointed by Washington 1 July 1795; rejected by the Senate 15 Dec. 1795.

William Cushing, of Massachusetts, appointed by Washington 26 Jan. 1796; declined promotion from his associate justiceship.

Oliver Ellsworth, of Connecticut, appointed by Washington 4 March 1796; resigned 1800.

John Jay, of New York, appointed by John Adams 19 Dec. 1800; declined.

John Marshall, of Virginia, appointed by John Adams 31 Jan. 1801; died 6 July 1835.

Roger Brooke Taney, of Maryland, appointed by Jackson 15 March 1836; died 12 Oct. 1864.

Salmon Portland Chase, of Ohio, appointed by Lincoln 6 Dec. 1864; died 7 May 1873.

George H. Williams, of Oregon, appointed by Grant 1873; rejected.

Caleb Cushing, of Massachusetts, appointed by Grant 1873; rejected.

Morrison R. Waite, of Ohio, appointed by Grant 21 Jan. 1874; died 23 March 1888.

Melville W. Fuller, of Illinois, appointed by Cleveland 20 July 1888.

Chief Justice, or **Lord Chief Justice**, in England; the presiding judge in the king's or queen's bench division of the high court of justice, and, in the absence of the lord-chancellor, president of the high court, and also, *ex officio*, one of the judges of the court of appeal. The chief justice of the court of common pleas, previous to 1881, was the presiding judge in the common pleas division of the high court of justice, but the office is now merged in that of the chief justice of England. The title chief justice is also generally given in the various British colonies to the heads of the different judicial establishments, as in Canada, Australia, etc. In Canada there is not only a chief justice at the head of the supreme court of the Dominion, but also chief justices in the separate provinces.

Chief of Staff. See GENERAL STAFF OF THE UNITED STATES ARMY.

Chiemsee, hēm-zā, the largest lake in Bavaria, circle Isar, district Tröstberg, 48 miles southeast of Munich; greatest length, 10 miles; greatest breadth, 9 miles; area, 74 square miles; depth, about 480 feet. It is of an irregular shape, very much indented, and contains three pretty islands—Krautinsel, Herrenworth, and Frauenworth.

Chieri, kē-ā-rē, Italy, in the province of Turin, eight miles east-southeast of the town of Turin. It is walled and well built, contains the largest Gothic church in Piedmont, with a very ancient baptistery, and at a very early period became celebrated for its manufactures of fustian, which are still flourishing. Pop. 10,000.

Chieti, kē-ā-tē, Italy, capital of province of same name, on a hill near the right bank of the Pescara. It was anciently one of the largest and most important towns in this part of Italy, and was for some centuries in possession of the Greeks, from whom it passed successively to the Romans, Lombards, Franks, and Normans. In 1802 it was taken by the French troops. The modern town, which is well built and adorned with several handsome edifices, is the see of an archbishop and the seat of a superior civil and criminal court, and has manufactures of woollens, and a trade in silk, wine, wheat, and oil. Pop. 12,273.

Chiff-chaff, a small European bird (*Sylvia hippolais* or *Phylloscopus collybita*), of the warbler family (*Sylviidae*), so named from its cry. Its head, back, and upper wings are ash brown, and its under parts are brownish green dashed with yellow. In length it is between four and five inches, and it frequents woods, hedges, and thickets. Its food consists of the larvæ of various insects and some of the smaller moths.

Chigi, kē-jē, a noble Italian family, founded by AGOSTINO CHIGI (d. 1512) of Siena. He became a patron of the fine arts and banker for the Pope. (See Cugnino's 'Agostino Chigi il Magnifico.') FLAVIO CHIGI (b. 1810) was one

CHIGNECTO — CHIHUAHUA

of the papal guard until 1848, when he was made Bishop of Mira *in partibus*, nuncio at Munich, but was sent to Paris (1873) and later made cardinal, d. 15 Feb. 1885. The head of the family is Prince of Campagnano and Duke of Ariccia. He is also hereditary marshal of the conclave.

Chignecto (shĭg-nĕk'tō) Bay, an inlet at the head of the Bay of Fundy, in the Dominion of Canada. It separates Nova Scotia from New Brunswick, is 30 miles long and 8 broad, and has an isthmus of only 14 miles in width between it and Northumberland Strait, in the Gulf of St. Lawrence.

In October 1888 work was begun on the construction of a ship railway across the neck of land connecting Nova Scotia with the main land of Canada, under the encouragement of an annual subsidy from the Canadian government. The promoters had spent nearly \$4,000,000 on the work, when in 1890 a financial depression in London prevented them from obtaining further capital. As the subsidy from the Canadian government was to be payable on the completion of the work in a given time, the contractors were unable to secure any aid from that source. In March 1901 the undertaking was revived. The railway was projected to be 18 miles long, and by uniting the Gulf of St. Lawrence with the Bay of Fundy and the waters of the Atlantic Ocean, a run of several hundred miles around the province would be saved.

Chignon, shĕn-yōn, a peculiar arrangement of the hair, worn by women, a knot or mass, natural or artificial, arranged low on the back of the head, at the nape of the neck. It comes from a French word meaning link or chain. This style of hair-dressing was common in the 18th century, but fell into disuse, was revived in the last half of the 19th century, not now in vogue.

Chigoe, chĕ'gō. See JIGGER; SARCOPSYLLA.

Chihuahua, chĕ-wā'wā, Mexico, a state bounded on the north by the United States, on the east by Coahuila, on the south by Durango, and on the west by Sinaloa and Sonora. It is the largest of the Mexican states, having an area of 227,468 square kilometres, or about three times that of the State of New York. The Sierra Madre range traverses the state, and the Sierra de Tarahumares lifts its peaks (Bufa de Cerro Prieto, Jesús y María, Mesa de Tabascotes, etc.) to a considerable height; otherwise the surface is an undulating table-land, the elevation of which varies from 3,500 to 7,000 feet above sea-level. The largest of the elevated plains lying between the mountain ranges are the Chilicote, Gigantes, Bolsón de Mapimi, etc. The Rio Grande forms the northern boundary, separating the state from the United States; but this river, which rises in Colorado and flows through New Mexico, is almost dry by the time it reaches Mexican territory, the greater portion of its waters having been utilized for the irrigation of lands in the country of its origin. The mineral resources of Chihuahua are probably not surpassed by those of any other region in the republic. Gold, silver, copper, and lead are being mined with profit, and it is thought that the deposits of coal will prove to be valuable when transportation facilities are provided. The climate is

healthful, though the summers are long. Even during the hottest months the nights are cool, and in winter frost and snow are not unknown. The summer is the rainy season. Cattle, sheep, horses, and mules are bred in great numbers. Haciendas, several hundred square miles in extent, are common, and 30,000 or 40,000 calves are branded yearly on some of the large ranches. The cultivation of cotton is restricted to the lower lands near the rivers; corn, wheat, oats, rye, potatoes, beans, and many fruits and vegetables of the temperate zone, grow readily in the uplands. Forests of oak and pine cover the mountain slopes in some parts of the state. Cedar is found in the Sierra Madre. There are nine colonies of Mormons, all successful in agriculture. Cattle, sheep, and hogs are exported to the United States. (For manufactures, see CHIHUAHUA [City].) The main line of the Mexican Central Railway runs through the state for a distance of 850 kilometres; a branch of that road crosses the mining district of Parral; the Mexican Northern Railway runs from Escalon to Sierra Mojada, state of Coahuila, connecting a region of low-grade lead ores with the Mexican Central system; and, finally, the capital of the state is to be united with mining and agricultural sections by the Rio Grande, Sierra Madre and Pacific Railway, and the Chihuahua and Pacific Railway, neither of which is yet completed. Wagon-roads are numerous and good. The state is divided into 10 districts, the names, population, and principal towns of which are as follows: Andres del Rio, population 14,450, principal town Batopilas; Arteaga, 8,075, principal town Chinipas; Bravos, 25,122, principal town Juarez (4,500); Camargo, 27,126, principal town Santa Rosalia; Guerrero 22,252, principal town Ciudad Guerrero (4,250); Hidalgo, 36,997, principal town Hidalgo del Parral (7,000); Iturbide, 72,869, principal town Chihuahua, capital of the state; Jimenez, 23,377, principal town Jimenez de los Santos; Mina, 16,978, principal town Guadalupe y Calvo; and Rayon 15,521, principal town Ocampo. Statistics of 1897 show 127 public and 45 private schools; total attendance 4,775 boys and 2,164 girls. The state has (statistics of 1902) a population of 262,271 persons, of whom 8,000 are Indians belonging principally to the Tarahumara race. Number of inhabitants to the square kilometre, 1.15.

Chihuahua, Mexico, the capital city of the state of the same name (q.v.). It is the metropolis of the entire northwestern section of the republic; supplies outfits for a majority of the mining camps and prospecting expeditions of the state; and has manufacturing establishments, banks, and commercial houses engaged in various branches of business. One of the largest iron foundries and machine factories in Mexico has its works here. Cassimères, blankets, carpets, cotton goods, beer, etc., are other products of the place, which is conspicuous among towns of its size and country for activity and enterprise.

In the Mexican war, Chihuahua was to have been occupied by Gen. John E. Wool; but the latter marched to Taylor's assistance, and enabled him to win the battle of Buena Vista. Col. Alexander W. Doniphan, however, sent by Gen. S. W. Kearney to reinforce Wool at Chihuahua, occupied the city

CHILAN BALAM — CHILD-LABOR

without opposition, and finding that he was not needed and Wool was not coming, soon abandoned it. Pop (1902) 25,000.

Chilán Balám, chē-lān' bā-lām', **Books of**, a series of Maya writings which have been preserved, supposed to have been written by a Maya priest by the name of Chilán Balám. They concern the life of the people before the arrival of the Spaniards; and it is said that the author prophesied the coming of a strange people.

Chi'law, Ceylon, a town on the west coast, near the mouth of the Dederoo-oya, 45 miles north by west from Colombo. Its proximity to the pearl-fisheries gave it an interest which it did not otherwise possess, and made it repeatedly the object of a keen contest. The Tamils wrested it from the Singhalese in the 14th century, and it afterward passed successively to the Moors, the Portuguese, and the Dutch. From the last it was taken by the British in 1796. In the forest to the east of Chilaw, within a radius of 20 or 30 miles, are contained the ruins of a number of ancient cities. The road leading from Chilaw southward to Negombo passes through almost continuous cocoanut plantations. Pop. 5,000.

Chilblain, or **Frostbite**, a mild or severe inflammatory reaction from the effects of severe cold on the toes, fingers, nose, chin, ears, etc. In mild cases there is swelling only, with an inflammation of the skin. This disappears and the part is apt to be tender. In severe frostbite there is ulceration and sloughing of the part. The treatment of mild chilblain is by slow raising of the temperature of the chilled part to that of the body. Too rapid heating results disastrously. Special clothing may be necessary for the tenderness, particularly of the feet.

Child, Francis James, American scholar and educator: b. Boston, Mass., 1 Feb. 1825; d. Cambridge 11 Sept. 1896. He was professor of rhetoric and oratory at Harvard from 1851 till 1876, when he exchanged for the chair of English literature. His principal work, 'English and Scottish Ballads,' a subject on which he was the highest authority in this country, he improved and enlarged for publication in 1886. Among his other works are 'Four Old Plays' (1848); a collection of 'Poems of Sorrow, Comfort, Counsel, and Aspiration' (edited 1865); and 'War Songs for Freemen' (edited 1862).

Child, Frank Samuel, American Congregational clergyman: b. 20 March 1854. He was educated at Hamilton College, N. Y., and after graduating from Union Theological Seminary in 1878 was ordained to the ministry. Since 1888 he has been pastor of the First Church of Fairfield, Conn. He has published 'An Old New England Town' (1895); 'The Colonial Parson of New England' (1896); 'A Colonial Witch' (1897); 'A Puritan Wooing' (1897); 'The House with 60 Closets' (1899); 'An Unknown Patriot' (1899); 'The Little Dreamer's Adventure' (1900); 'Friend or Foe' (1900).

Child, Sir Josiah, English merchant: b. London 1630; d. there 1699. The work by which he is known is entitled 'Brief Observations Concerning Trade and the Interest of Money, by J. C.' (London 1668). An enlarged edition

was published in 1690, under the name of 'A New Discourse on Trade.' The work has been several times reprinted. It was written in defense of the reduction, by legal enactment, of the rate of interest on money from 8 to 6 per cent, and recommends a further diminution to 4 per cent. He was for some time chairman of the East India Company, and wrote several papers, without signature, in defense of the traffic with the East, arguing, in opposition to those who complained of the drain of coin, that the India trade percolated through other countries with which Britain traded, and thus returned indirectly a surplus in cash. In his essay on trade he advocated the compulsory emigration of paupers to the colonies, and suggested the appointment of corporate officers called 'fathers of the poor' to superintend those who were left. He became very wealthy, and his children, by three marriages, allied themselves with the highest nobility. Charles II. made him a baronet. His son became Earl Tylney, but the title is now extinct.

Child, Lydia Maria Francis, American prose writer: b. Medford, Mass., 11 Feb. 1802; d. Wayland, Mass., 20 Oct. 1880. She was married to David Child, a Boston lawyer, in 1828. Her first novel, 'Hobomok,' was written and published in 1821. She was an ardent abolitionist, and published one of the first anti-slavery books, entitled 'Appeal for that Class of Americans Called African,' one immediate result of which was the loss of her former literary popularity in the southern States. From 1841 to 1844 she and her husband edited the 'National Anti-Slavery Standard.' Among her numerous works are 'The First Settlers of New England' (1829); 'Philothea, a romance of Greece in the days of Pericles' (1835); 'Fact and Fiction' (1846); 'Isaac T. Hopper: A True Life' (1853); 'Progress of Religious Ideas' (1855); 'Looking Toward Sunset' (1864); 'Miria: A Romance of the Republic' (1867); and 'Aspirations of the World' (1878). A collection of her letters, with an introduction by John G. Whitier, and an appendix by Wendell Phillips, was published in 1882.

Child-labor. The growth of child-labor is coincident with the introduction of machinery and the development of the factory system. Arkwright obtained his first patent for a machine for spinning cotton yarn in 1769, which immediately resulted in taking the manufactures out of the English cottages and farmhouses. Compton's spinning mule followed in 1775, Cartwright's power loom in 1787, and Eli Whitney's famous cotton-gin in 1793. The sudden displacement of home labor, the rapid development of manufacturing, and the substitution of mere mechanism for the skill of the individual operative, resulted in a demand for cheap child-workers. The employment of children soon became general, and large numbers were crowded together in factories, before the change had attracted much attention. It began with the apprentice system, the children being procured from the poorhouses of London, Birmingham, and southern England.

'Agreements of the most revolting character were often made between the manufacturers and the different parish workhouses for bands of children for a number of years, in which the condition of the children was totally disre-

CHILD-LABOR

garded. Such, for example, were those provisions whereby it was agreed that with every 20 sound children one idiot should be taken." (William F. Willoughby, American Economic Association, March 1890.) In 1784 the magistrates of Lancashire passed a resolution that apprentices should no longer "work in the night or more than 10 hours in the day." No protection was provided for children who were not parish apprentices, and no inspection was established, so that the resolution had no force, and remained a dead letter. In 1802 Sir Robert Peel, Sr., secured the passage of a bill abolishing the apprentice system, so far as the cotton factories were concerned. This mild measure met with bitter opposition from the manufacturers, and was of very little immediate benefit, but it was valuable as the first definite step to awaken public sentiment to the evil. According to Walker (Political Economy): "The beginning of the present (the 19th) century, found children of five and even three years of age in England working in factories and brick-yards; women working underground in mines, harnessed with mules to carts, drawing heavy loads; found the hours of labor whatever the avarice of individual mill-owners might exact."

In 1815 a parliamentary committee was appointed to "inquire into the expediency of extending the Apprenticeship Act to children of every description." During the next three years reports were presented which showed that the children employed were worked to the point of exhaustion, and that their condition was worse than slavery. In 1819 an act was passed forbidding the employment of children under 9, and the hours of labor for those between 9 and 16 were limited to 12 hours a day. In 1833 Lord Ashley, afterward Earl of Shaftsbury, introduced a bill which extended the provisions of former acts, and stipulated that inspectors should be appointed to enforce the law. During the following years until 1878 various progressive steps were taken, under the able championship of such men as Lord Shaftsbury and Robert Owen. The act of 1878 was the culmination, and is still regarded as an admirable code for factory legislation. It prohibits the employment of children under 10, and those under 14 may only be employed half time. Night work is forbidden, and children under 16 must furnish medical certificates of fitness for employment. Weekly certificates must be obtained, showing the required amount of school attendance.

During the first half of the 19th century, every political economist opposed factory legislation, and the employers were practically unanimous in their opposition to any abridgement of their right to employ children. The motives of the early reformers were exclusively humanitarian, and they advocated the necessity of protecting women and children because they are not "free agents." It is, however, generally conceded now that the real grounds of state interference with, and regulation of industry are considerations of the safety and well-being of the community. In accordance with this principle, acts were passed in 1891, 1895, 1898 to regulate home work, to prohibit the employment of women for one month after the birth of a child, to prevent and define overcrowding in future, and to minimize the evils of danger-

ous trades and occupations. A whole code of special rules for each dangerous trade has been formed by the home secretary, to enforce precautions for the protection of the workers, and an arbitration court is provided for the adjustment of protests. According to Thomas Oliver, "Experience shows that there is scarcely a dangerous trade from which, with extreme care and attention to regulations, the dangerous influences cannot be largely removed."

Perhaps the most marked difference between the development of child-labor legislation in Great Britain and in the United States, is this—that in Great Britain, a knowledge of the conditions has always preceded legislation, whereas in many of the American States legislation has been hasty and ill considered, and frequently in advance of public information and public sentiment.

Social legislation which affects industrial interests must be supported by an intelligent public opinion, which has been educated to believe that a state of evil exists, and that the remedies proposed are really necessary. The mere passage of a law may have a certain educational value, but it cannot be enforced without a public conviction of its value. In 1889 Mrs. John Armstrong Chanler offered a prize, through the American Economic Association, for the best essay on child-labor. The prize was divided equally between William F. Willoughby and Miss Clare De Graffenried, both of whom were connected with the Federal Department of Labor, and their essays are still the best general source of information as to the conditions in the United States. Mr. Willoughby says that in England "the regulation of factories and labor is the single duty of the central government, while here it falls to the different State legislatures. As a consequence, while throughout England the laws are uniform, and but one set of statutes and reports, those of Parliament, which are easily accessible, have to be studied; here no two States have the same laws; only a comparatively few have any at all; and information must be obtained through the various bureaus of labor or the reports of the inspectors of factories and workshops. . . . These reports are often unsatisfactory, and are confessedly unreliable. Each department is conducted in its own way. Some, with adequate means, are well organized, and their reports are of the greatest possible value, while others, with very limited resources, can do but feeble work. The law creating them has, in most cases, been inadequate and too timid." He adds that in no case can the statistics of one State be compared with those of another, and that the reports of the State bureaus are in most cases incomplete, "owing to the refusal of the factory owners to make returns or the gross falseness of many of those which were made." At the time Mr. Willoughby wrote (1889), the following States had organized labor bureaus: Massachusetts, 1869; Pennsylvania, 1872; Ohio, 1877; New Jersey, 1878; Illinois and Indiana, 1879; New York, Michigan, Wisconsin, Missouri, and California, 1883; Iowa and Maryland, 1884; Connecticut and Kansas, 1885; Rhode Island, Maine, Colorado, Minnesota, North Carolina, and Nebraska, 1887. In the 14 years which have intervened since Mr. Willoughby wrote, the following States have established bureaus of labor statis-

CHILD-LABOR

tics, or have provided for factory inspection, or have legislated in some way for the regulation of child-labor, namely, Alabama, Arkansas, Kentucky, Louisiana, Montana, North Dakota, Oregon, South Carolina, South Dakota, Tennessee, Texas, Virginia, Washington, and West Virginia; and legislation is now pending in the State of Georgia. There has been a great awakening of public sentiment on the subject of child-labor during the last few years and at the present time the general interest is intense. The governors of seven different States have referred to it during the past year in their annual messages, and in one form or another bills to regulate child-labor or amend former laws have been introduced recently in most of the manufacturing States. Much of this legislation is for the purpose of improving the administration of the departments of inspection, which is almost as lax as it was 14 years ago. Very little progress has been made in the compilation of data on child-labor. The writer has recently examined the reports for 1901 and 1902 of the various State bureaus of labor statistics and factory inspection, and can confirm literally to-day Mr. Willoughby's findings of 14 years ago!

In a number of the manufacturing States child-labor laws were first passed at the instance of the labor organizations, and for the purpose of placating the "labor vote." Many of the States have failed to make adequate provision for the cost of inspection, and only a few of the inspectors have been men of trained observation, or men whose previous experience has been such as to fit them in any way for the exacting duties of their office. In some States the department of factory inspection has simply been the foothall of politics, and the inspectors have been changed with each administration; while in others, the "spoils" have fallen to local labor leaders, who have been placed in positions of great responsibility, overloaded with diverse duties, and allowed a free hand without any supervision. For some reason or other, the laws for the regulation of child-labor have been fully enforced in a few of the States only, and much of the available data as to the number and ages of the children employed, is still very unreliable. The figures of the 12th census (1900) quoted below, may be taken as a minimum estimate only, since they are based on schedules filled out by the manufacturers themselves, at their own discretion, without any verification of the census taken. In fact, the director of the census says himself:

"The limitations connected with the taking of a great national census preclude proper care upon the question of child employment. There is a great uncertainty as to the accuracy of a mass of information of this character taken by enumerators and special agents, who either do not appreciate the importance of the investigation, or find it impracticable to devote the time to the inquiry necessary to secure good results. Again, the answer to the question, 'average number of children under 16 years of age,' may have been inconsiderately given, or, if considered, answered more as the word 'children' was construed by the individual than according to the interpretation intended by the schedule to be placed upon it. The word 'children' to manufacturers has many meanings, in accordance with the geographical location of their

plants, or the character of the work performed."

According to the census, the average number of children under 16 years of age (evidently including only those in factories) earning wages in 1900 was as follows:

States	No. children	States	No. children
Alabama	3,474	Missouri	4,510
Arizona	38	Montana	112
Arkansas	643	Nebraska	776
California	2,114	Nevada	20
Colorado	243	New Hampshire....	1,651
Connecticut	3,479	New Jersey	8,042
Dakota	6	New Mexico.....	29
Delaware	859	New York	13,189
District of Columbia	116	North Carolina....	10,377
Florida	374	Ohio	4,369
Georgia	6,373	North Dakota.....	37
Hawaii	40	Oregon	38
Idaho	23	Pennsylvania.....	33,135
Illinois	10,419	Rhode Island.....	5,036
Indiana	3,618	South Carolina....	8,560
Indian Territory....	16	South Dakota.....	114
Iowa	1,888	Tennessee	2,171
Kansas	860	Texas	1,041
Kentucky	2,687	Utah	218
Louisiana	1,321	Vermont	263
Maine	2,202	Virginia	4,164
Maryland	5,884	Washington	265
Massachusetts	12,556	West Virginia.....	840
Michigan	2,636	Wisconsin	5,679
Minnesota	792	Wyoming	15
Mississippi	1,049	United States.....	168,623

According to the United States agent of the Department of Labor, Mr. Wm. Waudby, there were approximately 860,700 children between the ages of 10 and 15 years employed in various "gainful occupations" in 1880 in the United States; in 1890 that number had grown to 1,750,000!

Miss De Graffenried's essay, referred to above, is still the best available statement of conditions of child-labor in many manufacturing industries, notably corset factories, box factories, packing houses, and tobacco and woolen manufacture. In 1891 she wrote an article (based on personal investigation) dealing with the deplorable conditions of child-labor in the southern cotton mills, which excited violent controversy in the South (Century Magazine, February 1891), but her assertions have been fully confirmed during the past two years by the child-labor committees of Alabama and Georgia. In the same way the statements made by Miss De Graffenried in her prize essay as to the evils of child-labor in the sweat-shops, and in the large department stores and mercantile establishments, have been completely verified by the subsequent investigations of the New York Tenement House Commission and the National Consumers' League. The determined and successful fight waged by the Alabama Child-Labor Committee, under the direction of Mr. Edgar Gardner Murphy of Montgomery, Alabama, for the passage of a law to forbid the employment of very young children, deserves special mention. His printed arguments are a part of the permanent literature of child-labor, and created such a wave of public sentiment, that the organized and powerful opposition of the cotton mill owners was finally overcome and the legislature forced to yield to the popular pressure. The owners of the cotton mills in Georgia put forward the plausible plea that compulsory education laws should precede legislation to prevent employment of children under 12. The effect of this would simply be to postpone action for another generation, since the State cannot afford to provide sufficient schooling

CHILD-LABOR

facilities until its resources increase in value, or its pensioners die off. At present Georgia is burdened with an annual pension tax of nearly \$1,000,000, and the misfortunes of the parents are reflected in the ignorance of their children. In this connection the following deductions from the census of 1900 are interesting:

White Children of School Age 5 to 20.		White Illiterates of 10 years and over.
Alabama	394,152	104,883
Georgia	457,958	101,264
North Carolina.....	490,782	175,917
South Carolina.....	218,323	54,719
Virginia	435,612	98,160

One main cause of the extent of child-labor abuses in the southern cotton mill States is the general lack of vagrancy laws. The "poor white" is shiftless and lazy, and will not work indoors, and in the general exodus of his family to the factory towns, he has been left out of the calculation. His wife and children find their way into the factories, while he exists on the proceeds of their labor. An action for non-support is almost unknown, and not only is there no apparent remedy for the evil, but the State by its failure to prevent the slavery of his children, puts a premium upon the idleness of the parent! Of course the enforcement of compulsory education laws, in conjunction with a simple educational test for children of school age who seek employment, is a powerful aid to the factory inspector. Indeed the State of New Hampshire controls the whole matter by giving its truant officers the right to enter all mechanical, mercantile, and manufacturing establishments, and make a rigid examination; and so far has not found it necessary to employ a factory inspector. But it is reasoned that if, in a community where free schooling is lacking, the factory owners were forbidden to employ children who cannot read and write, the practical result would be to induce the parent to provide for his children's education, in order that they might the sooner qualify as wage-earners.

The child-labor committee of New York has just won a similar victory in securing the passage of laws to license newsboys, and to protect telegraph, messenger, and delivery boys. This movement originated with the social settlement workers, whose daily life brought them into contact with the actual conditions of the "street boy." The report of this committee also is very valuable.

During the past winter the Anthracite Coal Strike Commission developed the fact that large numbers of children under the statutory age were employed in the coal mines and silk and knitting mills of Pennsylvania, under most distressing conditions. As the result of the commission's investigation, bills were introduced to raise the age limit of breaker-boys to 14, and of mine employees to 16, and to abolish the night work of little girls in mills and factories. The first two measures were supported jointly by the coal operators and their employees, and were passed. The other measure failed, but the various women's organizations of Pennsylvania have taken the matter up, and have organized a committee of citizens to fight for legislation and to see that existing laws are rigidly enforced.

The problems of child-labor are now engrossing the attention, not only of the econo-

mists, but of those who are engaged in studying the causes of social disorder, and seeking to prevent pauperism and disease. Charity workers have found that child-labor is wrapped up and interwoven with many of the problems of disease, of crime, and of dependence, and the Thirtieth National Conference of Charities and Correction, which met in Atlanta, Ga., May 1903, devoted two notable sessions to the discussion of 'Child-Labor as a National Problem.' The addresses and discussions will be published in the proceedings of the conference. The sixth annual meeting of the American Academy of Political and Social Science was also largely devoted to the subject, and the annals of the academy for July 1902 contain the papers which were read. The women's clubs are also agitating the subject continually, and the labor men no longer have to fight alone for the passage and enforcement of child-labor laws. In almost every State a strong body of public sentiment is being brought to bear upon the subject, and there is general demand for a thoroughly scientific investigation of existing conditions, and better facilities for regulating the employment of children.

The State of Massachusetts has hitherto supplied the standard of statutory law and administration in this department, but Mrs. Florence Kelley is now heading the forward movement for better methods, and her article in the Annals of May 1903 on 'An Effective Child-Labor Law' may be taken literally, as she suggests, as 'A Problem for the Current Decade.'

A careful study of the status of child-labor in Europe, as made by Miss Edith J. Rich, reveals the fact that "no state is without some protection against this evil, and no state affords a protection even approximately adequate. For a century and a half the separate countries slowly developed a public sentiment against child-labor and formulated laws upon the subject, but harmony of action was not attempted until 1890, when an International Labor Conference was held in Berlin. At this conference it was decided to recommend to every state in Europe the passage of the following law, as a safeguard against industrial decay: That children of either sex not having reached a certain age must be excluded from factories, the age limit to be fixed at 12 years, except for southern countries, where it be fixed at 10. Bald statistics show the following as the present conditions: In Switzerland the age limit is 14; France and Germany, 13; Hungary, Portugal, Holland, Sweden, Russia, Austria, and Belgium, 12; England, 11; Denmark and Spain, 10; Italy, 9.

But these statistics, unqualified, give no conception of the true state of affairs. England is, in reality, far from the bottom of the list in matter of protection, and Switzerland's position at the head would not pass unchallenged. And this for many reasons. In the first place, the age limit itself is invariable in few cases. In Hungary and Portugal, for example, the limit is fixed at 12, but may be reduced to 10 if the applicant has a medical and educational certificate of fitness, which is not at all hard to obtain. In England, on the other hand, the exception has the contrary effect. The limit is fixed at 11, but this is raised to 13 unless a child can show a proper certificate of education. In Ger-

CHILD-LABOR

many, Denmark, Austria, Norway, Sweden, and Russia, the tendency is also upward rather than downward from a given standard.

The next difficulty in the way of estimating European conditions from statistics, lies in the lack of harmony between child-labor laws and those cognate laws without which the former are ineffective. In Germany, for instance, child-labor is prohibited under the age of 13, and even then, unless the primary education is complete; the system of compulsory education is good; the employer is made liable for all risks, and there are special regulations for the dangerous trades; but the definition of a factory is so indefinite that many important industries escape factory jurisdiction entirely; the system of inspection is so incomplete and the penalties for violation so slight and so seldom enforced that a large and growing number of children are employed. It is said that the Saxon mines are full of children, and that in this same province children five and six years old are employed in the "flat-stitch" trade, earning two and one fourth cents an hour, and working from 10 to 12 hours a day.

Belgium shows much the same result from another cause. The laws are good and the system of inspection is almost unequaled, but compulsory education is unpopular there, and, as is always the case when educational laws do not supplement those prohibiting child labor by offering a substitute employment for the child, the effect of legislation is negated. There both the parent and employer are made liable for a violation of the law, and 45 trades are absolutely forbidden; but it is the custom to grant exemptions, and the census of 1896 showed that out of 671,596 laborers 76,147 were under 16 years of age. And even these startling figures do not include the workers in the domestic workshops, which are the *bête noire* of child-labor reformers.

These domestic workshops are a relic of a dead system in vogue before the rise of factories where labor is concentrated. They remain to-day in almost every country of Europe practically excluded from factory legislation. The line that divides factories from domestic workshops differs in all cases and is usually so drawn as to exclude from factory jurisdiction large and important industries, whose representatives have power enough to influence legislation. This is especially true in Russia, and is also notable in Belgium, where the entire clothing industry is beyond reach of the child-labor laws. In Austria it takes 20 persons to make a factory; in Italy 10 persons or the use of mechanical motors; in Germany the inspector is free to define an industry as it suits his purpose; in Switzerland the definition is as follows:

1. All industrial establishments where more than five persons are employed and use is made of mechanical motors or where persons under 18 are employed or which present unusual danger to the health or lives of employees.

2. All industrial establishments employing more than 10 persons, whether they present foregoing conditions or not.

3. All industrial establishments employing less than six persons and presenting unusual danger to health or lives of employees or those employing less than 11, but presenting plainly the type of factories.

And yet in spite of this inclusive definition the domestic workshops of Switzerland, which form a large part of Swiss industrial establishments, continue to employ children unmolested. The reason is not far to seek.

Among the leading Swiss industries are watch- and clock-making, the making of paper boxes, embroidery, wood-carving, silk- and cotton-weaving. For centuries these industries have been carried on in the provinces in small establishments, seldom employing more than 10 or 12 persons. In many cases the parent is the employer, and the children the only employees; in others apprenticeship is still in vogue, although that system practically died with the death of the trade guilds. The Swiss federal laws are limited to factories and dangerous trades, the cantons reserving to themselves the right of apprenticeship legislation. In the special Swiss industries, a certain deftness, flexibility and agility are required which can, with difficulty, be acquired by a person who has not begun the work in the early years before the joints and the fingers are stiff and the power to learn mechanically is lost. The conditions necessary to progress in these industries have therefore been an effective barrier to the enforcement of the laws militating against child-labor.

These laws, nevertheless, have by no means been void of good. Their presence on the Federal statute books has caused deep study of the methods by which they might be obeyed without injuring the industries of the country. The result has been the establishment of great trade training schools, still in their incipency, but offering to the student the largest hope for the future. In Berne, schools are already in active and highly successful operation, where a child may learn a given trade while he is receiving his general education. The system employed in these manual training schools must never be confused with the fundamentally opposite system of half-time employment which has proven distinctly unsuccessful in several countries, notably in England. Until such schools are established, however, or until some substitute for them is found, which shall at the same time displace the domestic workshops, there should be, in every country attempting to protect its children, inhibitory laws which shall make the employer responsible, according to the laws provided for factories, for all work from which he receives the profit, whether such work be done with or without pay (to include apprentices) and whether it be done on factory premises or at home; and, further, making the word "factory," as far as child-labor is concerned, cover every possible industry in which a child may engage.

In this connection it is interesting to note a French law, also recently adopted in Belgium, which forbids the employment of children under the age of 13 as actors or at public exhibitions of any kind, and further prohibits those under 16 from becoming acrobats or professional beggars. The Belgian law differs from the French in age restriction. In the former country the prohibition extends to all under 18, unless a parent is the employer, when the age limit is 14.

In the matter of night work and in special regulations against the employment of children in dangerous trades, the outlook is more generally hopeful, both in the matter of statutes

CHILD PSYCHOLOGY — CHILDREN

and of their enforcement. Even in Italy 21 trades are absolutely forbidden to children, in Russia 26, and in Belgium 45. Dangerous trades are of two general kinds—those in which the employment of children implies danger to the community, to risk of fire or accident, and those which are dangerous to the worker himself. The latter class is again sub-divided into those in which the danger is inherent or direct, as in the white lead industry, glass-blowing, phosphorus, etc., and those in which the danger is indirect through length of day, employment under ground, and like causes. A notable example of the last class is the mine, child-labor in which is prohibited in almost every country of Europe.

It is almost impossible to make a comparison of the European and American status of child-labor, because neither stands as a unit, being a composite of conditions in various States. The most suitable basis for future reform is harmonious action founded on a study of the universal principles that underlie this great question. What is needed is the universal minimum age limit of 14, which shall remain invariable and impossible of exemption except for unusual cases; a universally accepted definition of factories which shall include every industry in which it is possible for a child to be at work; a universal system of compulsory education to supplement child-labor laws; better factory inspection; stricter enforcement of penalties, and finally, the establishment of great trade schools the world over."

BIBLIOGRAPHY.—*American.*—Among the various reports and bulletins may be named the following: 'Bulletins of the Department of Labor,' and 'Eighteenth Annual Report of the Department of Labor,' Carroll D. Wright, Commissioner; 'Report of Commissioner of Education,' W. K. Harris (1901); 'Report of Anthracite Coal Strike Commission' (1903); 'Reports of Child-Labor Committee,' New York (1903); 'Report of Child-Labor Committee,' Alabama (1901); 'Reports of Industrial Commission'; 'Reports of the National Consumers' League'; 'Reports of the Industrial Association of Factory Inspectors.' Childbirth. See **OBSTETRICS**.

Childe Harold's Pilgrimage, a narrative poem in Spenserian stanza, written by Lord Byron (q.v.). It describes the impressions of a young man traveling in southern Europe, and is marked by a tone of melancholy and dissatisfaction. Many have supposed that Childe Harold represented the poet himself. The poem was published in four cantos, the first two appearing in 1812 and the others in 1816 and 1818.

Childebert, shēl-dē-bār or chīl'dē-bért, three kings of the Merovingian dynasty, France.

1. **CHILDEBERT I.**: b. about 495 A.D.; d. 558. On his father's death in 511 he succeeded to the kingdom of Paris; his brother, Clodomir, king of Orleans, having been killed in battle, Childebert and his brother, Clotaire, king of Soissons, determined to seize and divide his dominions, and murdered his two eldest sons and their followers. Childebert afterward quarreled with Clotaire and laid waste his territory.

2. **CHILDEBERT II.**: b. about 570; d. 596. On the death of his father in 575, he was proclaimed king of Austrasia, and subsequently, by the death of his uncle, Gontran, succeeded to the kingdoms of Burgundy, Orleans, and part of that of Paris.

3. **CHILDEBERT III.**, surnamed the Just: b. about 683; d. 711. He was proclaimed king in 695, on the death of his brother, Clovis III. His kingship, however, was merely nominal, the true sovereign being Pepin le Gros or d'Héristal, who, under the title of mayor of the palace, exercised the real authority.

Childermas (chīl'dēr-mas) **Day** (Feast of the "Holy Innocents"), a festival celebrated by the Roman Catholic Church, 28 December, in commemoration of the massacre of the male children by Herod.

Children, Societies for the Prevention of Cruelty to, organizations that had their origin in New York, and have since been adopted in most American and many European cities. Experience has proved that defenseless children, even within the range of our boasted civilization, are not infrequently grossly maltreated by parents or other legal protectors, and that therefore special legislation is necessary to secure their proper treatment. To ameliorate the condition of children has, therefore, entered largely into the scope of modern legislation. The operations of the societies show in the strongest light the necessity for their action, though it is but a few years since this special agency was introduced. Under seven a child is supposed to be incapable of committing felony. Between 7 and 14 it is held to be *doli incapax*, that is, incapable of crime, while above 14 it is *doli capax*, that is, capable of crime. If, however, anything atrocious be done with obvious malice by a child, it may be held that *malitia supplet aetatem*, malice supplies (the want of) age. The age at which a child can be sworn as a witness depends on the education it has received and its apparent comprehension of the nature and obligation of an oath.

CHILDREN IN THE WOOD—CHILE

Children in the Wood, The, or The Babes in the Wood, an old English ballad, telling the story of two children whom their uncle wished to murder and who were left to die in the woods, by the man who was ordered to kill them. The authorship is unknown, and the date uncertain; it appears in the 'Stationers' Register' of 1595, and was probably written about that time. An old play, published in 1601, has a similar plot, and the source of the two is supposed by some critics to be the same.

Children of the Abbey, The, a once famous romance, by Regina Maria Roche, published in 1798. The Earl of Dunreath, marrying a second time, is induced by the machinations of his wife to cast aside her stepdaughter, for a luckless marriage. It is with the children of this marriage that the story deals. The motherless Amanda is the heroine; and she encounters all the vicissitudes befitting the heroine of the three-volume novel. These include the necessity of living under an assumed name, of becoming the innocent victim of slander, of losing a will, refusing the hands of dukes and earls, and finally, with her brother, overcoming her enemies, and living happy in the highest society forever after.

Children of the Ghetto, a noted book by I. Zangwill, published in 1892. It is, as the author says, "intended as a study, through typical figures, of a race whose persistence is the most remarkable fact in the history of the world." The book raises problems that it does not solve; but the masterly and sympathetic exposition of the Jewish temperament invites a better comprehension of that wonderful race.

Children of Gibeon, a popular novel by Walter Besant, published in 1886. Like his 'All Sorts and Conditions of Men,' it deals with society in both the West and East Ends of London, and their relations to each other. The plot is so ingeniously managed that it seems entirely plausible; the studies of London wage-earners and London slums are faithful, without being too repulsive; and the tone of the book is cheerful, while many social problems are touched in the course of an entertaining story.

Children of the Soil, a novel of modern Polish life, by Henryk Sienkiewicz, published in 1894. There are interesting side issues to the story, involving questions of property, of the social order, of marriage. The work as a whole, although realistic, is sane in spirit, genial and broad in its conception of life and character.

Children of the World, a romance by Paul Heyse, published in 1873. It obtained immediate popularity, and caused great controversy over the fearless treatment of the theme. The children of the world are represented by a young doctor of philosophy, a strong, well-balanced character; his younger brother, an almost Christlike idealist; and their circle of friends and fellow-students, who, in spite of mistakes and eccentricities, bear the stamp of true nobility of soul.

Children's Crusade, The, a singular movement in 1212, preached in France by Stephen, a peasant boy, and in Germany the same year by Nicholas, also a peasant boy. Some 90,000 children left their mothers and schoolmasters in the spring "to rescue the Holy Land from the

infidels," and ships were placed at their disposal. The French contingent embarked at Marseilles in August; part perished the same month by shipwreck on the island of San Pietro, and the rest were sold into slavery to Mohammedans. The German contingent reached Genoa in August, and was utterly dispersed by various disasters before the next spring. See CRUSADES.

Childs, George William, American philanthropist and publisher: b. Baltimore, Md., 22 May 1829; d. Philadelphia 3 Feb. 1894. He published the Philadelphia 'Public Ledger,' 1864-94. He gave a Shakespeare memorial fountain to Stratford-on-Avon, a memorial window in Westminster Abbey to Cowper and Herbert, and assisted in establishing a home for printers at Colorado Springs. He published 'Recollections of Gen. Grant' (1885); and 'Personal Recollections' (1889).

Chile, chil'ē, or Chilī, chil'ī (the Republic of), situated on the western coast of South America, between the Andes Mountains and the Pacific Ocean, is bounded on the east by Argentina and Bolivia, and on the north by Peru. In length it surpasses even the Argentine Republic, for it extends from lat. 55° 59' S. to 17° 57' S., a distance of 2,629 miles, but its average width is only 101 miles. The total area is, therefore, about 265,529 square miles. Besides the Andean range on the east, there is a parallel western coast range, and in the valley between the two ranges, from Santiago, the capital, to the south, are found the best agricultural districts and many of the important towns.

Population.—Compared with the other South American countries, Chile ranks as the seventh in size, the fifth in density of population, and the fourth in the number of its inhabitants. The population of the republic in 1895 was 2,712,145, of which number 1,240,353 resided in cities and towns, and 1,471,792 in the rural districts. There has been a considerable increase during the last few years, and on 1 Jan. 1900, the total population was estimated at 3,110,088. The number of the inhabitants of the principal cities on the date last mentioned was, according to an official publication, as follows: Santiago, 291,725; Valparaíso, 135,674; Concepción, 49,766; Iquique, 42,440; Talca, 40,987; Chillan, 34,994; Antofagasta, 19,482; La Serena, 17,137; Talcahuano, 15,643; Curicó, 14,577; San Felipe, 12,359; Valdivia, 9,819; Copiapó, 9,586.

Climate and Productions.—The northern part of Chile is a hot desert; the southern part, a cold region of almost incessant rains; but between these extremes lies a great extent of territory blest with a temperate and healthful climate. Dividing the republic, for convenience of characterization, into five zones, we may say that in the northernmost zone there is a nearly absolute lack of vegetation, but yet we find here some of the chief sources of the national wealth—the deposits of nitrate of soda, mines, etc. The second zone, continuing toward the south, is less torrid. Rain falls several times in the year; and though mining is the chief industry, small areas are also devoted to agriculture. The third zone, in the centre of the country, has a temperate climate and fairly abundant rains. Cattle-raising, mining, and the cultivation of cereals, vines, and fruits are the leading industries. In the fourth zone, where

CHILE

rains are more abundant and the climate cooler, the chief products are wheat, cattle, lumber, etc. The fifth and most southerly zone, extending to Cape Horn, is a land of bold and rugged features with a cold and rainy climate—a land of shepherds, lumbermen, and fishermen.

National Finances.—The national debt of Chile on 31 Dec. 1901, as shown in the report of the auditor-general of the republic, amounted to 302,672,280.91 pesos (Chilean peso = \$0.365). Of this amount, 227,234,400 pesos were for foreign loans dating from the years between, and including, 1885 and 1894. A reduction of 2,896,607.26 pesos in the national debt was effected in 1901. The message of President Riesco (1 June 1902), shows that the revenue, ordinary and extraordinary, in 1901 amounted to 110,059,496.97 pesos. On 31 Dec. 1900 there remained a surplus of 18,576,829.43 pesos. These two sums make a total of 128,913,989.40 pesos. The total of expenditures in 1901 was 130,913,989.94 pesos. There was consequently a deficit of 2,277,663.54 pesos, which sum was increased by certain payments to 2,809,337.66 pesos. In 1902 the president anticipated a deficit of 29,719,339.31, "which may be reduced by 3,000,000 by certain economies, and almost totally met by the 20,000,000 in gold taken from the conversion fund and the premium paid upon this sum. The conversion fund will be made up again out of the sales of land in Magellan territory and of nitrate grounds." The estimated revenue for 1903 amounts to 107,000,000 pesos, and the estimated expenditure to 105,665,545.79 pesos. This somewhat unsatisfactory condition of the national finances may be traced to political events which will be mentioned under *History*. The foreign trade in 1901 amounted to 300,383,118 gold pesos, which which was the largest sum on record. Imports were 139,300,766 gold pesos; exports, 171,844,976 gold pesos, an increase of 10,223,079 gold pesos over 1900. Receipts of the custom-house amounted to 71,998,955 gold pesos, of which sum 27,872,696 gold pesos corresponded to imports and 44,126,259 gold pesos to exports.

Countries Leading in Trade with Chile.—The year 1901 cannot be regarded as normal in the matter of imports, the failure of the Chilean wheat harvest having occasioned an unusually large importation of wheat and flour in that year. Analyzing the figures for a normal year, 1899, we find that the five principal nations having commerce with Chile are:

COUNTRIES	Exports to in pesos	Imports from in pesos
Great Britain.....	110,528,378	44,338,050
Germany.....	20,921,999	29,748,898
France.....	9,334,281	5,525,162
United States.....	7,349,858	8,197,569
Peru.....	4,248,312	5,185,194

Of the Chilean products, which constituted the commerce of exportation, 84⅓ per cent belonged to mining; 10½ per cent to agriculture; 2½ per cent to manufactures; and the rest to various products and to coin. The imports of that year were classified as follows: Woollen goods, 29,058,119; raw material, 21,731,717; food-products, 17,696,659; manufactures, 14,032,630; machinery, 12,695,066; beverages and cigars, 1,268,099; sundry articles, 9,778,068.

Exports.—One of the principal exports is nitrate, the quantity and value of which has steadily increased during recent years. Chile, in fact, leads the world in the production of

nitrate of soda, no other country being able to supply this mineral in commercial quantities. The value of the exported nitrate in 1899 was 96,650,282 pesos; in 1900, 109,945,156 pesos; in 1901, 118,860,131 pesos; and in 1902 there was a still more noticeable increase in the amount produced. Copper bullion is also exported in considerable quantities, the amount in 1901 being 24,479,922 kilos, valued at 19,627,114 pesos. A decrease is noted during recent years in the exportation of wheat, flour, and barley. In 1898 wheat to the value of 7,696,460 pesos was exported; in 1899, flour to the value of 996,979 pesos, and barley to the value of 2,246,866 pesos. Chile exported in 1901, honey valued at 1,034,088 pesos, and beeswax valued at 582,045 pesos; hay to the value of 260,815 pesos; wine, 68,344 pesos; and gold and silver coin, 13,150 pesos.

Mining.—Chile is the second largest silver mining country in South America, and the third largest copper producer in the world. In the northern zone, notably in the province of Antofagasta, extensive deposits of calcium borate are being worked. The annual exports from the manganese mines in Coquimbo and Atacama are between 20,000 and 25,000 tons. Other minerals, with amounts produced in the year 1900, are: Coal, 896,000 tons; iodine, 318 tons; and gold, 4,576 pounds. The nitrate of soda produced in that year weighed 1,465,935 tons.

History.—The dominion of the Incas of Peru included the northern and central portions of Chile—at least to lat. 37° S. In 1535 the Spanish conquerors of the Inca empire sent their first expedition southward along the Pacific coast; but the task of adding this territory to the Spanish possessions in Peru and Upper Peru (Bolivia) was not undertaken in earnest until 1541, nor was it brought to a successful conclusion before 1550. The courageous Araucanians offered a stubborn resistance to Valdivia's forces, and even as late as the 18th century they made good their prior claim to a large part of the country below lat. 37° S.

Independence and Adoption of Constitution.—In September 1810 was formed the first national government, to rule the country during the captivity of the king of Spain, whom the French held as a prisoner. From that time forward the design to achieve independence was never relinquished, though the events of the years immediately following were of a character to discourage patriotic aspirations. The Chileans were defeated and compelled to return to a nominal subjection; the final success was won with the help of Argentine troops under Gen. San Martin (see ARGENTINA), and the independence of the country was proclaimed in 1818. A constitution, adopted in 1824, and remodeled in 1828, was given its final shaping—substantially the form which it still retains, though modifications demanded by the progress of the country have been made—in 1833. (See under *Government*.) Independence was recognized by a formal arrangement with Spain, and embodied in the treaty of 1844. In 1865, however, a war broke out between the mother country and Chile and Peru, hostilities continuing until 1869. After an interval of peace, the important "war on the Pacific" began.

The War on the Pacific.—For many years the rights of Bolivia and Chile, respectively, in certain mining lands bordering on the Pacific Ocean remained without definition, but in 1874

CHILE

an agreement was entered into between the two countries which apparently disposed of the questions at issue. The exploitation of these lands by Chileans increasing, Bolivia saw fit to reopen the dispute by imposing an export tax on the nitrate, or "saltpetre," obtained in Bolivian territory. A Chilean company refused to pay the tax, alleging that it contravened the treaty of 1874. The Bolivian government's reply was an order for the sale by auction of the property of the offending company, on 13 Feb. 1879. Thereupon the Chilean government sent a man-of-war to seize the port of Antofagasta. It soon became apparent that Chile would be obliged to deal with Peru also in this matter; and in fact a secret offensive and defensive alliance against Chile had been formed by Bolivia and Peru in 1873. On 5 April 1879 Chile declared war against the latter republic. Tacna and the neighboring port of Arica were occupied by the presidents of Peru and Bolivia with their troops; the defense of Iquique was entrusted to a sufficient force, and at Lima a reserve of about 10,000 men was held in readiness to meet the Chileans at any point that might be attacked. The plans of the allies seemed to be well laid, and some initial successes fell to their share.

Capture of the Huáscar.—Two Chilean warships, the *Esmeralda* and the *Covadonga*, blockading Iquique, were attacked by the Peruvian frigate *Independencia* and the monitor *Huáscar*. The *Esmeralda* was sunk by the *Huáscar*, but the latter vessel on 18 October fell in with the *Cochrane* and *Blanco* of the Chilean navy north of Point Mejillones. A fight of great severity ensued. Only 86 men were left alive on board the *Huáscar*, out of her complement of 216, when she was obliged to surrender. This vessel was repaired and added to the Chilean navy.

Triumph of Chile.—Pisagua was captured from the Bolivians by Chilean warships. On 18 Nov. 1879, the allies were defeated in the battle of San Francisco, but before the close of the same month they scored a dearly bought success against the Chilean forces in the battle of Tarapacá. Chilean divisions commanded by Gen. Baquedano invested the town of Moquegua, and on 23 March 1880 entered Torata. Two months later a decisive contest occurred, the city of Tacna (now the capital of the Chilean province of that name) being taken on 26 May. The troops of the allies, including 5,120 Peruvians and 3,200 Bolivians, commanded by Admiral Montero, and the Bolivian president, Gen. Campero, sustained a crushing defeat. Arica, the port of this district, was attacked by the land and sea forces of Chile in June, and fell after making a desperate resistance. In order to emphasize the defeat and to cripple the more important members of the alliance, the Peruvian coast was laid waste, Mollendo was destroyed, Callao and other ports blockaded, and an expedition under Baquedano's command made ready to proceed to Lima. See PERU.

Acquisition of Territory.—As the fruits of her victory, Chile took from Bolivia the districts of Cobija and Atacamá; from Peru the coast line north of the Bolivian possessions to, and including, conditionally, the province of Tacna. Thus Chile's territory on the Pacific was extended northward from the old boundary, at lat. 24° S. One of the allies was cut off from communication with the outside world by way

of the Pacific Ocean; and a strategic frontier was established against the other ally. A truce, instead of a treaty, was concluded between Bolivia and Chile after the war, the sentiment of the Bolivians being utterly averse to any permanent arrangement which did not give them access to the sea. Renewal of negotiations for a definitive treaty, which should include the concession of a seaport, has been repeatedly urged by Bolivia, but hitherto without effect.

Treaty of Ancon.—Peru, by the terms of the treaty of Ancon (1883), surrendered to Chile absolutely the valuable nitrate district of Tarapacá, but with respect to the Tacna-Arica region a peculiar convention was made. It was agreed that Tacna-Arica should be governed by Chile for a period of 10 years, and that at the end of the decade the vote of the inhabitants should decide whether it would be better for the province to revert to Peru or to be administered by Chile in the future—the country thus rejected by popular vote receiving from the other country \$10,000,000 silver by way of compensation. Nearly 20 years have passed, and the Peruvian government has repeatedly urged fulfilment of the treaty, but the plebiscite has not yet been held.

Balmaceda.—Some of the amendments to the constitution which we have referred to above were adopted before the outbreak of the war with Peru and Bolivia; they embodied the liberal ideas which, in 1874, triumphed over the conservatism of the proprietors of large estates—a class practically dominating the government's policy up to that time. The most forceful of the liberal leaders who effected this important political change was Balmaceda, a member of Congress in 1868, minister to the Argentine Republic at the time of the war with Bolivia and Peru, and, in 1885, elected to the presidency of the republic. The conspicuous success of President Balmaceda in his advocacy of measures relating to internal improvements, a system of popular education, the separation of Church and state, etc., created bitter antagonisms. United in opposition to him were all those who disapproved of his vigorous liberalism on principle, and all who were jealous of his power as an individual. In 1888 his cabinet was overthrown; his unyielding attitude in this crisis provoked an armed revolt; and the country was plunged into civil war, the operations of the forces of the revolutionists being directed by a junta representing Congress, and the president somewhat too readily assuming the powers of a dictator for the defense of his position. Balmaceda was defeated, and died by his own hand on 19 Dec. 1891.

The effect of this civil war upon Chile's foreign credit was deplorable. With characteristic enterprise her people have developed the resources of the country in many new directions, yet the utmost wisdom and firmness in the administration of her government have been required to bring about even such conditions of the national finances as we have stated. On the other hand, the country was fortunate in escaping a serious foreign war.

The Baltimore Incident.—The opinion prevailed in Chile when this conflict was at its height that the United States government, through Minister Patrick Egan, was showing favor to the cause of Balmaceda, and discriminating against the congressional party.

CHILE

The fierce resentment felt by the latter expressed itself in an attack upon sailors of the United States cruiser *Baltimore*, who became involved, while on shore, in a brawl with Chilean sailors. There was a riot of the populace in the streets, and several of the *Baltimore's* men were seriously or mortally wounded. When a report of this indignity reached Washington, suitable representations were made by the authorities there, but unfortunately it was necessary to address such representations to a merely provisional government at Santiago. The latter not only refused the just demand for satisfaction, but also insisted in offensive terms that the men who had been assaulted should be handed over to Chile for trial as criminals. An improvement in this threatening situation occurred when the management of Chilean affairs was entrusted to President Montt, and when the demand of the United States was emphasized by the sending of two additional warships to Chile. The new president tendered apologies for the discourtesy of the provisional government, as well as for the attack upon men wearing the uniform of the United States; and compensation was made to the wounded sailors, or to the families of those who had died.

Arbitration and Limitation of Naval Armaments.—On 28 May 1902, the plenipotentiaries of Chile and the Argentine Republic concluded two important agreements, the first of which provides for the arbitration of all questions not affecting constitutional precepts, or that cannot be settled by direct negotiations. It is entitled a "General Treaty of Arbitration," and the desire, is expressed in its introductory clause "to settle by friendly methods whatever questions may arise between the two countries." The second agreement is entitled a "Convention on Naval Armaments," which has "the object of removing all causes of anxiety and suspicion." The two governments "renounce the acquisition of the war vessels they have in construction and the making for the present of any new acquisitions"; agreeing, moreover, to reduce their respective fleets until they arrive at "a prudent equilibrium." In this connection we note that the launching of the first iron steamer built in Chile took place on 24 Nov. 1901 at Valparaíso. The entire ship, from keel to truck, was of domestic construction.

Government.—The national Congress is composed of two chambers: (1) The chamber of senators, with 32 members, elected for a term of six years by direct vote and by provinces, in the proportion of one senator to each three deputies; (2) the chamber of deputies, with 94 members, elected for a term of three years. Congress exerts a certain amount of control over the president of the republic by giving or refusing its confidence to the cabinet ministers appointed by him—as illustrated in the contest with Balmaceda. To represent Congress in the period of its recess, there is a Permanent Committee of 14 members, one-half chosen by each chamber.

The president of the republic holds office for five years, and he cannot be re-elected for the next consecutive period. A council of state, composed of 11 members, some of whom are appointed by the president, and others by the chambers, has the power to intervene in certain appointments, and its consent is necessary for the promulgation of the laws, the granting of

pardons, and some other matters. This council is not to be confused with the cabinet, in which are but six ministers or secretaries, to wit: The minister of the interior; of foreign affairs; Church, and colonization; of justice and public instruction; of war and the navy; of the treasury; of industries and public works.

The judicial branch of the government comprises: The supreme court of justice, located at Santiago, and composed of seven members, with authority over all other tribunals of the republic; the court of appeals, for the great districts of Tacna, Serena, Valparaíso, Santiago, Talca, and Concepción; one or more justices of the peace in each department of the republic; and sub-delegation or minor district judges. Juries exist only for suits involving the question of abuse of the freedom of the press.

For the purposes of political government, Chile is divided into 23 provinces and one territory. The provinces are divided into departments, the departments into sub-delegations, and the latter into districts. For the purposes of local administration, the republic is divided into municipal circumscriptions, or communes, one for each 20,000 inhabitants. A list of the provinces follows, beginning at the north: Tacna, Tarapacá, Antofagasta, Atacama, Coquimbo, Aconcagua, Valparaíso, Santiago, O'Higgins, Colchagua, Curicó, Talca, Linares, Maule, Ñuble, Concepción, Bio-bio, Arauco, Malleco, Cautín, Valdivia, Llanquihue, and Chiloé. The territory referred to above is Magallanes, at the southern end of the continent.

Education.—In 1901 there were 1,700 public schools, with 124,265 names of scholars on the books, and an average attendance of 79,666. During the first six months of 1902, there were opened 88 new schools and three new lycæums. The University of Chile in its various departments (including law, engineering, medicine, theology, and the fine arts) has an attendance of 1,300. Other public educational institutions are: The National Institute, with 1,200 pupils; Institute of Pedagogy; about 30 lycæums of secondary instruction for men; and 15 lycæums for girls; 6 normal schools; a Conservatory of Music; a Commercial Institute; also schools of fine arts, agriculture, arts and trades, mining, for the blind and for deaf-mutes, professional schools for girls, and industrial schools. Private educational establishments are numerous and receive pupils from other Latin American countries. The Roman Catholic University has courses of engineering and law. There are several museums of natural history and fine arts; an Astronomical Observatory, and meteorological observatories; botanical gardens, and, in various parts of the country, 41 public libraries, with 240,000 volumes.

Army and Navy.—By the law of 31 Dec. 1896 the maximum strength of the active army was placed at 9,000 men, and in 1899 the effective strength of the active army was stated to be 6,987 men; nevertheless a system of military instruction and drill is enforced which practically renders a much larger number available for military service in an emergency—possibly 10 regiments of infantry, 6 of artillery, 8 of cavalry, and one of military engineers. Establishments for military instruction are the Academy of War, the Military School, and the School for Sergeants and Corporals. The Chilean navy includes nearly 40 vessels of various classes:

CHILE SALTPETRE — CHILIASM

the armor-clad *Capitan Prat*, O'Higgins, and Almirante Cochrane; the monitor *Huáscar*; five protected or armored cruisers; five gunboats and torpedo-cruisers; four destroyers; 13 torpedo-boats; a training ship, etc. Naval instruction is given on board the vessel last mentioned, as well as in the academy at Valparaíso.

Railways, Postal Service, etc.—The state railways in operation in 1901 had an extent of 1,420 miles, and private railways 1,430 miles. Including several hundred miles which have been constructed since that time, we may say that there are somewhat more than 3,000 miles of railway in the republic; and the interesting statement is made that, although the government lines transported nearly 6,500,000 passengers and 2,500,000 tons of freight in 1899, "the net product was small, because rates are kept very low, for the purpose of promoting the public wealth by facilitating intercourse and the interchange of products." All the more important cities have street railways.

There are about 740 post-offices, and the total delivery in 1899 was 40,000,000 pieces. Newspapers, reviews, and other periodical publications are circulated free of postal charges, in the interest of the public education. The telegraph service is chiefly performed by the state, the private lines being only about 2,800 miles in extent, out of a total of 14,000 miles. Two lines of underground cables cross the Andes, and there are two submarine cables. Telephone companies have about 15,000 miles of wires in operation in the larger towns.

Agriculture, and Various Industries.—There are approximately 6,200,000 acres under cultivation, while the total area of arable land is probably not less than 25,000,000 acres. The production of wheat in good seasons is about 22,700,000 bushels, and of barley about 4,250,000 bushels. Other grains, fruits, and vegetables are raised in large quantities in the central provinces. The cultivation of the vine has received much attention during a score of years; in fact, this industry ranks next to cattle-raising in certain districts. Even the island of Juan Fernandez (made famous by Defoe's story of 'Robinson Crusoe') is included in the plans for industrial development. This island, lying 600 miles west of Valparaíso, belongs to Chile, and arrangements are being made quite seriously for turning to some good account the interesting little possession.

Milling holds the first position among Chile's manufacturing industries. More than 500 flour mills, supplied with the most modern machinery, are in operation in different parts of the country, especially the provinces lying south of the capital. Wood-working and tanning, and the manufacture of woolen cloth, building materials, and coarse paper are also worthy of mention.

MARRION WILCOX,
Authority on Latin-America.

Chile Saltpetre. See NITRATE OF SODA.

Chi-Li, or Chih-Li, China, one of the 18 provinces into which the country proper is divided. It has an area of 58,949 square miles and is bounded north by Mongolia, east by the gulf called Pe-Chi-Li, and by the province of Shang-Tung, and west by the province of Shan-Hsi. Chi-Li is in many respects the most important of the Chinese provinces, containing as it does the imperial capital, Peking, the treaty port of Tien-Tsin, and the only completed line of railway in the empire. The Great Wall runs across the whole of the northern part of Chi-Li, while on the coast are the forts of Taku, and the nearest approach to a naval station belonging to the Chinese government. The province is mountainous and traversed by important rivers, notably the Pei-Ho, the Lan, the Ho-Kien, and the Hu-to. The Yu-Ho is especially important because of the canal system developed throughout its course in Chi-Li. The provincial administration is in charge of a viceroy (Tsoung-tou) and a Fou-youn or sub-governor. There are numerous towns of the first, or Fu, class, second, or Chou, class, and third, or Hien, class. These towns are surrounded by walls. There are Christian missionaries of many denominations throughout the province. In 1900 the population was estimated at 25,000,000, including a large Manchu element. They are generally engaged in commerce, Chi-Li having much communication with Russia by way of Siberia. The climate is at times severe, the Pei-Ho being generally frozen over from December to March.

Chiliasm, kíl'í-ázm, the belief that Christ will come to earth and rule the world from Jerusalem for 1,000 years. The Latin word millennium means the same thing. The Revelation of John is the chief authority of the Chiliasts. Papias, Justin Martyr, Irenæus, Tertullian, and Lactantius were Chiliasts, but Origen was opposed to the notion. Papias, bishop of Hierapolis, says, in the millennium every vine will bear 10,000 branches, every branch 10,000 shoots, every shoot 10,000 sprigs, every sprig 10,000 bunches, every bunch 10,000 berries, and every berry 36 times 25 gallons of wine; and if a saint comes to pluck a berry it will cry out, "Pluck me, O saint; I am better for being plucked, praise the Lord." The Fifth Monarchy Men were, of course, Chiliasts, only they maintained that the golden age had begun, and that they were of it.

CHILKAT—CHILLINGHAM WHITE CATTLE

Chilkat (chīl'kāt) **Inlet**, the western arm of Lynn Canal, an inlet in Alaska, in about lat. 50° 7' N.

Chilkat, or **Dalton, Pass**, a route in Alaska traversed by miners in reaching the gold fields of the Klondike. It is an overland trail, which was used for many years by J. Dalton, a trader, as a pack train route and for driving in cattle. It follows a direct course, more or less independent of waterways, from Chilkat Inlet to Fort Selkirk, and is said to be less difficult than the road over Chilkoot Pass.

Chilkoot (chīl'koot) **Inlet**, the eastern arm of Lynn Canal, an inlet in Alaska. It is again subdivided, its principal arm being called Taig, an inlet which stretches for 15 miles north and south in about long. 135° 20' W.

Chilkoot Pass, a pass over the mountains in the northern part of Alaska, traversed by thousands of gold-seekers in the Klondike gold fields' excitement in 1897-8. By way of the Chilkoot Pass is the most direct route to Dawson City, the principal starting point to the Klondike region. The trail starts from Dyea, along the river of that name, and crosses the Pass at an elevation of 3,500 feet, to the head of Lake Lindeman, a total distance of 28½ miles. From the latter place to Dawson City is 548 miles. The Chilkoot Pass route is the old trail used for generations by the Indians, and for many years was the only one taken by miners and prospectors to reach the interior. It is by far the shortest route to the Yukon. The difficulties and dangers attending this route are many, and the steepness and roughness of the ascent have proved fatal in numerous instances, to those unaccustomed to endure hardships. The summit of the Pass is 13 miles from Dyea, the first six miles being traversed by a good wagon road. Owing to the winding of the Dyea River that stream must be crossed several times by ford or ferry. The trail then enters a narrow cañon with steep, rocky sides, which it follows to Sheep Camp, four and a half miles farther on, which point is the timber line. From Sheep Camp to the summit the rise is from 1,800 feet in three and a half miles, to 1,000 feet in half a mile, and here masses of broken rock make the ascent, which is in some places almost perpendicular, difficult and hazardous. It is at this point that the aerial tramway is built.

Chillan, chēl-yān', Chile, capital of the province Ñuble, about 75 miles northeast of Concepcion. It consists of an ancient and a modern portion, the former built by the Spanish conquerors, who made it a place of some strength, in which the early settlers often found an asylum when hard pressed by the Araucanians. The old town was founded in 1579, and destroyed by an earthquake in 1835. The new town was built shortly after the latter date. Pop. 29,000.

Chilled Iron, iron cast in metal molds called chills, where, on account of the rapid conducting of the heat, the iron cools more quickly on the surface than it would do if cast in sand. Chilled iron is whiter and has a harder surface than iron cast in any other way. It is used in making axle-boxes, hubs, plowshares, and some hammers and anvils.

Chillianwalla, chī-lī-an-wāl'a, a village of the Punjab, about five miles from the left bank

of the Jhelum, 85 miles northwest of Lahore, famous for a well-contested battle fought in its vicinity, in 1849, between the British under Lord Gough and the Sikhs, in which the former, though they remained masters of the field, lost 2,269 men. A second battle fought about six weeks after, at Gujerat, nearly annihilated the Sikh force.

Chillianwalla, Battle of, an engagement in India between the Sikh forces in considerable strength, and the British commanded by Lord (afterward Viscount) Gough, fought 13 Jan. 1849. The Sikhs were completely routed, but the loss of the British was very severe: 26 officers were killed and 66 wounded, and 731 rank and file killed, and 1,446 wounded. The Sikh loss was 3,000 killed and 4,000 wounded. On 21 February, Lord Gough attacked the Sikh army, under Shere Singh, in its position at Goojerat, with complete success; and the whole of the enemy's camp fell into the hands of the British.

Chillicothe, chīl-lī-kōth'ē, Mo., a city and county-seat of Livingston County; on the Wabash, the Chicago, Milwaukee & St. P., and the Hannibal and St. J. R.R.'s, 70 miles east of St. Joseph. It is a farming trade centre and has several manufacturing industries. It is the seat of the Chillicothe Normal School, State Hospital, State Industrial School for Girls, and St. Mary's Hospital, and is near the noted health resort, Laurel Mineral Springs. It has several daily and weekly newspapers, electric lights and street railroads, and two national banks. Pop. (1900) 6,905.

Chillicothe, Ohio, city and county-seat of Ross County, on the Scioto River, Point Creek, the Norfolk & W., the Cincinnati, H. & D., and the Baltimore & O. R.R.'s, and the Ohio & Erie Canal, 50 miles south of Columbus. It is an agricultural and coal-mining region, and has flour mills, foundries and machine shops, daily and weekly newspapers, three national banks, and an assessed property valuation of \$6,000,000. Chillicothe was the first capital of the State. Ohio celebrated in May 1903, her 100th birthday as a State, and it was peculiarly fitting that Chillicothe should have been chosen as the place for the celebration, for all the historic memories of the early years of the State's existence cluster about this city. It was here that Gen. Arthur St. Clair set up his Territorial government, as governor of the Northwest Territory; it was here that the agitation for Statehood gathered momentum, led by a quartet of Chillicothe men—Thomas Worthington, Nathaniel Massie, Edward Tiffin, and Duncan McArthur. It was here, on 29 Nov. 1802, that a constitution for the State was adopted, in compliance with the requirements of the Federal Constitution; and, finally, it was here, in the spring of the succeeding year, that the young State was ushered into being and Edward Tiffin elected her first governor. Pop. (1900) 12,970.

Chil'lies, the fruits of the Capsicum, used to make cayenne pepper, pickles, and chilli vinegar. See CAYENNE PEPPER.

Chil'lingham White Cattle. See WHITE CATTLE.

CHILLINGWORTH — CHILTON

Chillingworth, William, English Anglican divine and controversialist: b. Oxford October 1602; d. Chichester, Sussex, 30 Jan. 1644. He was matriculated in Trinity College, Oxford, in 1618, and in 1628 was made a Fellow of the same college. Having been won to the Roman Catholic Church through the arguments of the Jesuit Father Fisher, Chillingworth entered the English College at Douai, where Laud, then bishop of London, by correspondence implanted in his mind doubts regarding the foundation of the Roman Catholic system; and, resolved to make a thorough investigation, Chillingworth returned to England after a few months abroad. The result was that he declared for Protestantism and in 1634 set forth, in a treatise that was not published and is now lost, the grounds of his conclusion. Laud procured his nomination to a church benefice in 1635, but Chillingworth's scruples about subscription to the 39 articles and acceptance of the Athanasian creed was an obstacle that could not then be overcome. In 1637 was published his great work, 'The Religion of Protestants: a Safe Way to Salvation.' In the preface he explained away his former scruple about the 39 articles, and the next year was named chancellor of Sarum with a prebendaryship annexed. When Gibson in his autobiography explains his own religious experiences, which closely resemble those of Chillingworth, he insinuates that the reconverted convert afterward repudiated privately the cardinal doctrines of the Church of England.

Chillon, shē-yōn or shīl'ōn, a castle, Switzerland, on the Lake of Geneva, 6½ miles southeast of Vevey, once an important stronghold of the counts and dukes of Savoy, and the prison-house of Francis Bonivard, prior of St. Victor, Geneva, from 1530 to 1536. It stands on a rock rising 22 yards from the shore of the lake, and is reached by a bridge. It probably dates from the 9th century. Bonivard was confined in it by the Duke of Savoy because he had assisted the republic of Geneva, with which the Duke was at enmity. Byron's poem, 'The Prisoner of Chillon,' founded on this incident, has made it well known.

Chilo, kī'lō, one of the seven wise men of Greece. See **CHILON**.

Chiloe, chē-lō-ā', Chile, province of, consists of the island of that name on the west coast, which is separated from the mainland by a narrow strait on the north and by a gulf 30 miles wide on the east, and has a length of 115 miles, and an extreme breadth of 43 miles, and of a number of neighboring islets, mostly uninhabited; total area, 3,995 square miles; almost all Indians living on the principal island. Chiloe proper is hilly in the interior, and everywhere covered, except immediately along the shores, with nearly impassable forest. The climate is mild and not unhealthy, although inordinately wet. The Indians belong to a subdivision of the Araucanian family; they are a gentle and honest race, mostly engaged in fishing and in lumbering, timber being at present the chief export from the island, though immense deposits of coal have been reported. Oysters, which are very

scarce elsewhere in South America, are found in large quantities in the Chiloe Archipelago. The potato here, as in other parts of South America, grows wild. The capital, Ancud, on the north coast, has a good harbor, is the seat of a bishop, and has a population of (1895) 3,182. Pop. of province, 82,362.

Chilognatha, kī-lōg'na-thā. See **DIPLOPODA**; **THOUSAND-LEGS**.

Chilon, kī'lōn, one of the so-called seven wise men of Greece. He flourished about the beginning of the sixth century B.C., and was a native of Sparta, and one of the Ephori, a body of magistrates which he is even said to have originally introduced. A collection of his sayings may be seen in Orelli's 'Opuscula Græcorum sententiosa' (1819).

Chilopoda, kī-lōp'ō-dā, a group of myriapods represented by the centipede (q.v.). In these animals the body is composed of from a few to between 100 and 200 segments; the body is flattened, and there is but a single pair of legs to each segment. There are three pairs of mouth-appendages,—that is, a pair of jaws succeeded by two pairs of accessory jaws; while the first pair of legs are modified to form the poison fangs, which contain at their base a poison sac, the ducts from which open by a minute pore, out of which the blood oozes when the creature bites. The *Chilopoda* are divided into four families,—*Lithobiidae*, *Scolopendridæ*, *Gnaphalidae*, and *Scutigeridae*.

Chilperic, chīl'pē-ric, two Merovingian kings: 1. **CHILPERIC I.**, king of Soissons: d. 584. He never was acknowledged king of all the Frankish land, but divided the kingdom with his three half-brothers; he had, however, great power throughout their dominions by reason of his influence with the nobles. The murder of his wife, Galswintha, involved him in a war with her brother-in-law, Siegbert of Austrasia. 2. **CHILPERIC II.**, king of Neustria: d. 720. He was several times at war with Charles Martel (q.v.), but was forced to submit to him, and was in 719 made king of the Franks.

Chil'tern Hills, a range of flint and chalk hills in England, extending through Oxford, Hertford, and Buckingham shires; loftiest summit, 905 feet. These hills were anciently covered with forests, and were infested by numerous bands of robbers. The steward of the Chiltern Hundreds is an officer of the Crown, appointed to protect the people of Bucks from the robbers of the Chiltern Hills. This office is now a sinecure, but as a member of Parliament can only resign his seat by accepting office, he accepts this sinecure, which he immediately vacates for the benefit of others. The stewardship of the manors of East Hundred, Northshead, and Hempholme, are other sinecure offices made use of for the same purpose.

Chiltern Hundreds. See **CHILTERN HILLS**.

Chil'ton, Robert Hall, American soldier: b. London County, Va., 1817; d. Columbus, Ga., 18 Feb. 1879. He graduated at West Point 1837; became captain of the First Dragoons 6 Oct. 1846, and was brevetted major for gallant and meritorious conduct at Buena Vista, Mexico, 23 Feb. 1847. In this battle Jefferson Davis, afterward president of the Southern Confederacy, but then colonel of the First Mississippi

CHIMÆRA — CHIMNEY

Rifles, was severely wounded, and Chilton bore him from the field, a life-long friendship resulting from the event. He became a brigadier-general in the Confederate service 20 Oct. 1862, was chief of staff to Gen. Lee, and inspector-general of the Army of Northern Virginia. After the war he was engaged in business in Columbus, Ga.

Chimæra, *kī-mē'ra*, in classic mythology, a monster, breathing flames, with the head of a lion, the body of a goat, and the tail of a dragon, which laid waste the fields of Lycia, and was at last destroyed by Bellerophon, with the help of Pegasus. Her form is described by the poets as an unnatural mixture of the most incongruous parts. Therefore the name of *chimæra* is used for a nondescript, an unnatural production of fancy. According to some *Chimæra* was a volcano in Lycia, around the top of which dwelt lions, around the middle goats, and at the foot poisonous serpents. Bellerophon is said to have been the first who rendered this mountain habitable.

Chimæroidea, one of the primary divisions of fishes, the equivalent of *Holocephali* (q.v.).

Chimango, *shē-mán'gō*, a carrion hawk of South America (*Ibycter chimango*), closely related to the Caracara (q.v.) The plumage is black, with whitish streaks on neck and breast in the adult, which are lacking in the young. These birds are particularly numerous in the Falkland Islands. Darwin describes them as without fear of man, frequenting inhabited regions and feeding on all kinds of refuse.

Chimborazo, *chēm-bō-ra'sō* or *chīm-bō-ra'zō*, Ecuador, a peak of the Andes, in the province of Quito. Though not the loftiest summit of the Andes, it rises 20,700 feet above the sea-level, and its top is covered with perpetual snow. Through the transparent air it presents a magnificent spectacle from the shores of the Pacific. This mountain was ascended in 1802 by Humboldt and Bonpland, who, though they failed to reach the summit, yet mounted to the great height of 19,390 feet, a greater elevation than ever was before attained by man. Their further ascent was prevented by a chasm 500 feet wide. The air was intensely cold and piercing, and owing to its extreme rarity blood oozed from their lips, eyes, and gums, and respiration was difficult. In 1880 the summit was reached for the first time by Mr. E. Whymper.

Chimere, *shī-mēr'*, the upper robe to which the lawn sleeves of a bishop are attached. In the Roman Catholic Church it is of purple silk, and of black satin in the Church of England.

Chimes, music mechanically produced by the strokes of hammers against a series of bells, tuned agreeably to a given musical scale. The hammers are lifted by levers acted upon by metallic pins, or wooden pegs, stuck into a large barrel, which is made to revolve by clock-work, and is so connected with the striking part of the clock mechanism that it is set in motion by it at certain intervals of time, usually every hour, or every quarter of an hour. The music thus produced may consist of a direct succession of the notes constituting an octave, frequently repeated, or it may be a psalm tune or short pop-

ular air in the key to which the bells are tuned. This species of mechanical music most probably had its origin, like clock-work itself, in some of the monastic institutions of Germany, in the Middle Ages. The first apparatus for producing it is said to have been made at Alost, in the Netherlands, in 1487. The chime mechanism may be adapted to act with the large bells of a church steeple, by means of wheel-work strong enough to raise heavy hammers; or a set of bells, of different diameters, may be arranged concentrically, within one another on one common axis, sufficiently small to be introduced into the frame of a clock, or even of a watch. The chime mechanism is sometimes so constructed that it may be played like a piano, but with the fist instead of the fingers. This is covered with leather, that the blow on the key may be applied more forcibly. Difficult as the performance is, some players can execute compositions consisting of three parts, and even produce trills and arpeggios. Burney relates that the chime-player Scheppen, at Louvain, laid a wager with an able performer on the violin that he would execute a difficult solo for the violin with the bells, and won his wager. Pott-hoff, organist and chime-player at Amsterdam, played his bells with the facility of a performer on the pianoforte, although every key in his apparatus required a force equal to a two-pound weight. Burney heard him perform some fugues in 1772. The finest carillons or sets of musical bells are to be found in Belgium, at Bruges, Ghent, Antwerp, Namur, and Mechlin. These consist of from 40 to 50 bells, the largest weighing several tons, the smallest only a few pounds. Instead of bells, sometimes bars, wires, or tubes are used.

Chim'ney, an upright structure of stone, brick, etc., enclosing one or more flues or passages through which smoke and gas from the fire in a stove, furnace, or fireplace may escape into the open air. How far the Greek and Roman architects were acquainted with the construction of chimneys such as we have is a matter of dispute. That kitchens and baths were provided with chimneys appears certain, but how far other apartments were so provided is doubtful. An ancient mosaic found in Algeria, and representing a Roman country mansion, shows chimney stacks projecting above the roof. Of course in southern Europe fires are less necessary than in northern Europe. Chimneys require much attention to make them secure and prevent their smoking, so great an annoyance to domestic comfort. It seems at present to be acknowledged that it is much better to exclude the cold, damp air from the flues, by narrowing the aperture at the top, than to give larger vent to the smoke at the risk of admitting a quantity of air to rush down the flue. For this reason chimney pots are of great use. In Prussia, where the architectural police is strict, great attention is paid to the erection of chimneys, and to the regular sweeping of them, the chimney-sweepers being bound to sweep the chimneys of a certain number of streets within a regular time. The longer a chimney the more perfect is its draft, because the tendency of the smoke to draw upwards is in proportion to the difference of weight between the column of air included in a chimney, and an equal column of external air; and the heated air in the chimney being lighter

CHIMNEY-SWALLOW — CHINA

than the external air, the longer the chimney is the greater is this difference. Short chimneys are liable to smoke, and fireplaces in upper stories are therefore more apt to smoke than those in the lower ones. Two flues in the same chimney should not communicate with each other short of the top. In manufactories tall chimneys are built for the purpose of carrying away the great quantities of smoke, which would otherwise be highly deleterious to the health of those living in the neighborhood. In chemical works, especially, these chimneys are sometimes built to an immense height. Such chimneys are now built from the inside, by which the expense of the scaffolding is saved.

Chimney-swallow, a species of swallow (*Hirundo rustica*) so-called because of its habit of selecting chimneys and similar sites for its nests. The bird covers the whole of Europe and extends into China, and is one of the most common of the bird kingdom throughout the world, for it has relatives in Africa and America, where the chimney-swift is recognized as belonging to the same group. See SWIFTS.

Chimoio, Africa, a town in the Portuguese possessions, near the border of Mashonaland, 118 miles from Beira on the coast. A railway connects it with Fontesvilla, 28 miles northwest of Beira, and is being continued inland to Salisbury.

Chimpanzee, chīm-pān'zē or chim-pān-zē', an anthropoid ape (*Anthropopithecus niger*), native in the equatorial region of Africa. In size it is between the orang and the gorilla, although when seen it exhibits little of its stature, for it rarely stands upright, its habitual attitude being that of a bent creature, supporting itself on its long forearms. As the chimpanzee is arboreal in its habits, its hands and feet are larger, in proportion, than those of other apes, and this enables it to climb to the topmost branches of the great trees for soft fruits and insects, birds' eggs, and similar fare. The appetite for fruits makes the chimpanzee a menace to the plantations, especially when bananas are in edible condition. The natives guard the plantations, and as the animal is timid toward man this usually saves the crop; but when he cannot run away, the chimpanzee at bay is a formidable foe, using his long, sinewy arms and sharp teeth with deadly effect. He is even said to be a match for the leopard.

The habits of chimpanzees are largely nocturnal, and their long-drawn, loud, and terrifying cries may be heard at great distances. In the black recesses of the jungles, these cries would serve as calls to stragglers of the troop, and might also, by their suggestion of large numbers, scare away enemies. The nests whereon the females rest when bringing forth and rearing their young, are platform-like structures, built high in the tree-tops; these are deserted as soon as the young one is able to travel.

Chimpanzees are more nearly human in their action and intelligence than any of the other large apes, and many experiments have been tried in training and teaching them. Indeed, they have been made the subject of careful psychological investigation in various ways. They are playful and amusing, and exhibit none of the facial sombreness and ferocity of the gorilla, which they so closely resemble in structure.

The skin on the face of the chimpanzee is naked, yellowish in color, and surrounded by the long black hair which hangs about the head and shoulders. The body is covered with shorter, but equally shining black hair.

Various records are extant as to the training and habits of famous specimens of this species, kept under observation in various zoological gardens. Consult: Hartmann, 'Anthropoid Apes' and general works on natural history. See APE; GIBBON; GORILLA; ORANG-UTAN.

Chin-fly, a horse bot-fly (*Gastrophilus nasalis*) which has been confused with the horse-bot (*G. equi*). This species is smaller than the bot, densely hairy, with the thorax rust-colored. The abdomen is whitish at base and the wings are not spotted. It deposits its white eggs on the hairs about the lips or in the nostrils of equine animals, within easy reach of the tongue, and it is probable that the maggots hatch out more promptly than in the other species. It has been found common and troublesome in Kentucky. Also, in Europe it is a parasite of the ass, mule, and goat. See BOT-FLY; HORSE BOT-FLY.

Chin-Kiang, chīn-kē-āng', or **Chin-Kiang-Foo**, a city of China, in the province of Kiang-Su, on the right bank of the Yang-tse-Kiang, near the junction of the Imperial Canal, 150 miles from Shanghai. In 1861 it was made a treaty port. It is advantageously situated for trade, as the river is navigable for large vessels. Extensive suburbs stretch along the river and the canal. Chin-Kiang forms the key of the empire, as the blockade of the river and canal at this spot would in a great measure prevent all communication between the north and south. The city was formerly fortified, but has been dismantled. In 1842 it was taken by the British after a determined resistance on the part of the Manchu garrison. It was also taken by the Tai-ping in 1853. They defeated the Imperialists here on 1 Jan. 1856, and finally abandoned the city in 1858. Cotton goods form the chief import, and the exports are numerous and valuable. Pop. 200,000.

Chin-Wang, chīn'wāng', a city of China, in the province of Chi-Li. It was declared a treaty port and opened to foreign commerce in 1898. Pop. (1900) estimated 39,000.

China, or **Chinese Empire**, an immense territory, stretching from the centre to the eastern extremities of Asia, and occupying nearly a third of the surface of that continent; between lat. 18° 20' and 56° N., and lon. 73° and 135° E.; bounded north by Siberia; west by Russian Turkestan, the Russian Pamir, Cashmere, etc.; south by India, Burma, Anam, and the China Sea; east by Siberia, Korea, and portions of the North Pacific Ocean (Eastern Sea, and Yellow Sea); greatest length, west to east, about 3,000 miles; greatest breadth, 2,400 miles; area, about 4,300,000 square miles. This vast empire is usually divided into China Proper, which forms its nucleus, and the following Dependencies:

Manchuria (Chinese, *Tung-san-Sheng*) comprises the extreme northeast portion of the Chinese empire. It is bounded on the north by the river Amur and Russian territory, east by the Russian maritime province, west by Mongolia, and south by the Gulf of Liao-Tung and Korea. It is divided into the three provinces

CHINA

Mukden, Hei-lung-Kiang, and Kirin, the respective capitals of which are Mukden, Tsitsihar, and Kirin. The total area is 280,000 square miles. *Mongolia* is the name given to the vast stretch of desert land which, interspersed with infrequent oases, stretches across the greater part of the north of China along the Siberian frontier. A large part of its area of 1,288,000 square miles is taken up by the Gobi desert. The population is almost entirely nomadic. The chief town is Urga. *Eastern or Chinese Turkestan* is a mountainous region lying between the western tract of the Gobi desert and the Pamirs, and enclosed north and south by the ranges of the Tian-Shan and the highlands of Cashmere and Tibet. It possesses an area of 431,000 square miles. The principal towns are Kashgar and Yarkland. *Sungaria or Dzungaria*, the smallest of the tributary states of China, lies to the northwest of Turkestan, on the banks of the Ili River, at the junction of Mongolia, Turkestan, and the Russian province of Semipalatinsk. Its area covers 147,900 square miles, and its population is said to amount to half a million. *Tibet* comprises the mountainous region lying between Turkestan and Nepal and Assam. On the east it adjoins China Proper, and on the west Cashmere. It covers an area of 651,500 square miles. Its capital is Lassa.

The authority exercised by the Chinese over their dependencies is by no means uniform. Some of the dependencies are closely connected with the empire, while others are merely tributary; and Tibet is so independent as to do little more than profess a nominal allegiance to the emperor of China, as the suzerain of the country.

CHINA PROPER (anciently *Cathay*; Chinese, *Chung Kwoh*, "Middle Kingdom") forms the southeastern portion of the empire, and occupies less than a third of its whole extent. Not including the island of Hainan, it lies between lat. 20° 20' and 41° N., and lon. 98° and 123° E. China is bounded, north by one of the most remarkable of human structures, the Great Wall, which proceeds directly over mountain and valley, and for a length of 1,250 miles forms the barrier between China and Mongolia; on the west it is bounded by Tibet; on the south by Burma, Tonkin, and the China Sea; and on the east by the North Pacific Ocean. There are 18 provinces with area and population as follows:

Provinces	Area; English square miles	Population	Population per square mile
Chi-Li (Pe-chi-Li).....	115,800	20,937,000	172
Shan-Tung	55,970	38,247,900	683
Shan-Si	81,830	12,200,456	149
Honan	67,940	35,316,800	520
Kiang-Su	38,600	13,980,235	362
Ngan-Hui	54,810	23,670,314	432
Kiang-Si	69,480	26,532,125	382
Che-Kiang	36,670	11,580,692	316
Fu-Kien (Fokien).....	46,320	22,876,540	494
Hupeh	71,410	35,280,685	492
Hunan	83,380	22,169,673	266
Shen-Si	75,270	8,450,182	111
Kan-Su	125,450	10,385,376	82
Sze-Chuen	218,480	68,724,890	314
Kwang-Tung with Hainan	99,970	31,865,251	319
Kwang-Si	77,200	5,142,330	67
Kwei-Chau	67,160	7,650,282	114
Yunnan	146,680	12,324,574	84
Total	1,532,420	407,253,029	av. 266

Physical Features.—The coast-line, forming an irregular curve of about 2,500 miles, gives about one mile of coast for every 500 miles of area. It is not deeply penetrated by gulfs, the only one of great extent being that of Pe-chi-Li in the northeast, but numerous indentations form safe and capacious roadsteads. With exception of a bold and rocky peninsula in the province of Shan-Tung, the shore from the Gulf of Pe-chi-Li south to the island of Chusan is flat, and in many places so little raised above the sea-level as to be extensively inundated during a continuance of strong winds. From Chusan to the mouth of Canton River it is usually rocky; from this point southwest, flats chiefly prevail. A peninsula of some size juts out in the extreme south from Kwang-Tung province, separated from which by a narrow strait is the large island of Hainan. Chusan Island and archipelago are also of importance, but most of the innumerable islands dotted round the Chinese coast are very small. The large island of Formosa, off the east coast, now belongs to Japan. Many lighthouses have been planted along the coast. Owing to the exclusive policy of the Chinese and their dislike of foreigners, a great part of the interior of the country must be regarded as still almost a *terra incognita*. The surface is mostly mountainous. The general slope is from west to east, and the mountains are a continuation of those of Tibet and Central Asia. Branches of the Kuenlun traverse almost the whole breadth of China. In Western Sze-Chuen, there are peaks reaching the height of 25,000 feet. In the north the Nan-shan branch of the Kuenlun range runs under various names along the northeast of China till it reaches the frontier of Manchuria, north of Peking. A third great mountainous region of China is in the southeast, where extensive chains stretch on the south of the Yang-tse-Kiang all the way from the highlands of Yunnan to the eastern seaboard. Between the main mountain systems, and following courses which may be roughly described as parallel, run the two great rivers of China, the Hoang-Ho, and the Yang-tse-Kiang. Here lie the central and richest Chinese provinces. On both sides of the lower Hoang-Ho is an immense delta plain, consisting generally of a deep alluvial soil of unparalleled fertility. This great plain has a length of not less than 700 miles, and a width varying from 150 to 500 miles, and probably maintains a denser population than any other portion of the earth's surface of similar extent.

Rivers and Lakes.—No country of the world is better watered than China. The Yang-tse-Kiang, which traverses the country centrally from west to east, has a course of some 3,000 miles, and forms a splendid inland waterway up which ocean steamers can sail for 1,100 miles to Ichang, a port opened to foreign trade. The Hoang-Ho, farther north, and next in size, has a course of over 2,600 miles, but is of much less value for commerce, being comparatively shallow, subject to tremendous and disastrous floods, and apt to shift its course. The Grand Canal connects the lower course of the Yang-tse with that of the Hoang-Ho, starting from Hang-Chau Bay in the south, and being continued to Tien-Tsin in the north, thus completing what is said to be the most magnificent system of water communication in existence. This great waterway has, however, been greatly

CHINA

neglected, and threatens to become unnavigable, unless the necessary repairs are taken in hand. Besides these rivers and their numerous tributaries, the most deserving of notice are the Si-Kiang in the south, of considerable size but still more commercial importance, having at or near its mouth Canton, Hong Kong, and Macao; and the Pei-Ho, which, though much smaller, forms a waterway between Peking and the Gulf of Pe-chi-Li. The lakes of China, though rather numerous, are not individually of great extent. Perhaps the largest is Tung-Ting, in the province of Hunan, which furnishes an affluent to the Yang-tse-Kiang, and has a circuit of 270 miles. Po-yang, in the province of Kiang-Si, is 90 miles long by 20 broad, abounds in fish, and is remarkable both for the picturesque scenery around it and the numerous beautiful and populous islands which it encloses.

Climate.—The greater part of China belongs to the temperate zone, only a small portion of the south lying within the tropics. It has what is called an excessive climate, and has a far greater range of temperature than is usual within the same parallels of latitude. Peking, the capital, is nearly a degree south of Naples, and yet while the mean temperature of the latter is 63°, that of the former is only 54°. In summer, however, the heat reaches from 90° to 100° in the shade, while the winter is so cold that the rivers usually continue frozen from December to March. At Hong Kong, notwithstanding the influence of the sea in checking extremes, the thermometer in June and July, the hottest months, frequently stands at 90°, and in winter, from December to March, sinks nearly to the freezing-point. At Canton, snow, though rarely, has sometimes fallen. At Shanghai, lat. 31° 20', the range of temperature is still greater, the maximum reaching 100°, and the minimum falling at least 20° below freezing, or 12° F. In the south the climate is of tropical character, the summer heat rising to 120°. Here the southwest and northeast monsoons blow with great regularity, and nearly divide the year. In the north they are more variable. The violent hurricanes known as "typhoons" are not uncommon in the Chinese seas.

Geology.—The geology of China is very imperfectly known, but there is no doubt that all the leading geological formations are found in it. Primary formations are most largely developed in the mountainous regions of the west, where granite, gneiss, and primitive schists prevail. The same formations exist to a more limited extent in the southeast, where bleak mountains of granite give that district a distinguishing feature. The secondary formation, including the carboniferous and cretaceous system, occupies a considerable area, and the coal fields of China are perhaps the most extensive in the world. The Tertiary formation has its largest development in the northeast, and probably underlies the greater part of the alluvium which covers the surface of the Great Plain. A surface feature of a great part of northern China is the earthy deposit known as "loess," which covers an immense area both of mountain and valley, forming a yellowish-brown soil of the utmost fertility.

Mineralogy.—China is well supplied with useful minerals. Gold, though not thought to be very abundant, is obtained by washing the sand of several of the rivers, particularly those of

the upper branch of the Yang-tse, and in the mountainous and almost inaccessible regions of Yunnan. Silver is also found in the same regions. The quantity suffices for a large annual export, chiefly in payment of opium and other goods. Copper, besides forming the ordinary currency in limited mercantile transactions, is worked to a great extent for economical purposes. Mercury or quicksilver, in the form of cinnabar, is of frequent occurrence, and is much used both for coloring and medicine. Its poisonous fumes are even said to be inhaled like opium or tobacco. There is no want of iron either in the form of rich hematite, or in that of the carbonate of the coal-measures, but smelting is not carried on to any considerable extent. Lead, tin, and zinc exist, but owing either to a deficiency in quantity, or ignorance of the method of extracting them economically from the ores, the native product falls short of the consumption. Some authorities reckon the coal-fields of China as equal in value to all the other coal-fields of the world together, and some time they must certainly become of immense economic importance to the country. The area of the coal deposits in the southeastern part of the province of Hunan is about 21,700 square miles. The coal occurs both bituminous and as anthracite, but as most of it is raised without machinery, by the rudest forms of manual labor, the price is necessarily high, and the quantity mined is trifling. Defective means of communication partly account for backward state of coal-mining. Coarse mixtures of culm and earth are used as fuel to some extent, while other still more inefficient and less attractive compounds are employed. Among other mineral substances may be mentioned nitre, alum, gypsum, and more important than all, inexhaustible beds of kaolin or porcelain earth, the early possession of which by the Chinese, and their great skill in working it, has given the name of China to the beautiful ware which so long monopolized the market of Europe. Jade appears to be found in China in its most perfect form, and is there held in the highest estimation, being wrought into trinkets and into ornamental articles of various kinds. Various precious stones also are found, and agates especially are admirably wrought.

Zoology.—China is said to possess about 200 indigenous mammals and over 760 birds, most of which are found in adjacent parts of Asia, and some are also European. Among the *mammalia* are several species of the monkey tribe, one of them being the so-called Cochin-China monkey, marked by a striking variety of stripes and colors. Another is the proboscis monkey. Tigers and leopards were at one time so numerous as to have been regularly hunted in state by the emperors, but these animals have been extirpated except in certain localities, especially in Yunnan and Manchuria. A small species of wild cat is sought for as game, and served at table as a delicacy. Bears are frequently mentioned, and their paws are said to be in high request among Chinese gourmands. Other *carnivora* include the lynx, badger, civet, marten, and weasel. The elephant, rhinoceros, and tapir occur in some localities of the southwest. Both camels and elephants are employed as domestic animals, the former only in the north. Bats are numerous, and one large species is extensively used as food. To the indige-

CHINA

nous animals already mentioned may be added the wild hog, porcupine, raccoon-faced dog or Chinese fox, and several species of rats, more especially one of a yellow color, larger than those of Europe, and much prized for its skin. Several species of deer are met with, one being the musk deer. In birds, as above indicated, China is extremely rich. Pheasants in particular are famous, both for variety and for beauty. Among others are the well-known gold and silver pheasants, the former one of the most gorgeous of the feathered tribe. The peacock is also indigenous, and fowls akin to our common domestic variety. Birds of prey include eagles, falcons, owls, etc. Song birds, such as the nightingale and thrush, are well known and much appreciated. Water-birds of almost every kind abound, such as ducks, geese, swans, pelicans, etc. The mandarin-duck is a Chinese species famed for beauty of plumage. But perhaps the most remarkable water-bird is the fishing cormorant, the training of which forms an important employment, and is so complete, that when a bird has secured a fish which from its size he cannot manage singly, his neighbor darts down and assists him to complete the capture. The reptiles of China include several large serpents not regarded as dangerous, and one species at least which is very venomous. Tortoises are common, and are often kept in gardens and pleasure-grounds. No country is said to possess a greater number and variety of indigenous fishes than China. All its waters—its rivers, lakes, pools, canals, and even ditches—are full of fish. This is partly owing to the artificial means by which the natural supply is vastly increased. Boat-loads of water containing spawn are carried to distant parts and deposited in ponds, where the fry are fed with various species of lentils, or with yolks of eggs.

Botany.—The flora is naturally extensive and varied. In the south it is tropical in character, farther north, sub-tropical, and still farther there are many plants and trees identical or nearly so with those of middle Europe. Among trees commonly found in China the bamboo (if this gigantic grass should be called a tree), as in India, is perhaps the most valuable of all on account of the almost endless uses to which it is applied. Oaks of different species are common, and the economical uses of the various parts—the wood, bark, and galls—are perfectly understood. Even the acorns of some kinds are ground into flour, and converted into a farinaceous paste. Coniferous trees are represented by numerous forms of pine, yew, and cypress, some of them of great economic importance. The tallow and camphor trees abound, as also the mulberry and paper-mulberry. Palms are not abundant, but the coconut flourishes in Hainan and on the adjacent coast. The Pandanus or screw-pine is abundant in the south, but the date-palm is not known. The chestnut, walnut, willow, and hazel are all indigenous. The fruit-trees include the fig, mango, guava, lichi, loquat, orange, peach, pomegranate, quince, nectarine, plum, apricot, etc. Plants producing lacquer or varnish, and medicinal herbs of various kinds (including ginseng), are also well known. Among shrubby plants, the first place is unquestionably due to the tea-plant, of which further mention is made below. The next in importance is the

mulberry, on the leaves of which the silkworm is nourished. Among flowering shrubs or trees are the rose, with its numerous varieties, the hydrangea, the passion-flower, the lagerstroemia, Indian pride, the Chinese tamarisk, various species of cactus, and the camellia. The Chinese flora is particularly rich in varieties of the azalea. Altogether the abundance of flowering-plants, shrubs, and trees is a feature of the Chinese flora. Dwarfing is a favorite occupation, and the Chinese horticulturists force plants to assume the most fantastic forms.

Agriculture.—This first of arts has always been held in the highest veneration in China. The emperor himself, to do it honor, repairs annually to an appointed spot with a large retinue, and, taking the plow in his hand, draws a furrow and sows some seed. A similar festival is held in the capital of each province. The agriculture of the Chinese has been lauded in high terms by almost all who have had opportunities of witnessing it. In the important processes of stirring the soil, eradicating weeds, economizing manures, and applying them in the form best fitted to nourish the crop and bring it to maturity, they display unwearied industry and no small degree of skill. On account of the dense population, every square foot of land that can be made to raise food is kept in constant service and at the highest point of fertility. Even mountain slopes are terraced and tilled, sometimes to the height of 8,000 feet, wheat or other grains being the usual crop in these places. The farmers slavishly follow a routine which has been handed down without change from untold generations, and not only display no inventive powers themselves, but obstinately refuse to profit by the inventions of other countries. Their implements generally are of the rudest description, and though improved European and American plows have been sent out and urged on their acceptance, they reject them with disdain, preferring a rude shapeless thing drawn by oxen or buffaloes. They appear to have no idea of raising improved breeds of horses and cattle by the arts so well known and practised in other countries. The only animal of which the Chinese can be said to have furnished us with an improved breed is the pig. Their asses and mules are also of good quality. Rice, as the principal food of the people, is the staple crop. The rich alluvial plains which cover a great part of the surface are admirably adapted for its culture, and, by careful management, yield amazing crops—not one merely, but in the south latitudes two crops of rice in the hot season, besides a winter green crop usually plowed in for manure. In the neighborhood of Ningpo, lat. 30°, where the summer is too short to mature two crops in succession, they are still obtained by an ingenious device. The rice is sown in seed-beds, and afterward planted out in drills. A first planting is made about the middle of May, and in two or three weeks after, a second planting is made in the intervals between the previous drills. When the first crop is reaped in August the other is still green, but being stirred and manured, and having plenty of light and air, comes rapidly forward, and is reaped in November. The whole steps of the process are conducted with the greatest care; and the water-wheel, worked by the hand, or by an ox or

CHINA

buffalo, is kept in daily operation from the first planting of the crop till it is nearly ripe. The reaping instrument is not unlike our sickle; and the crop, when not thrashed on the field, as is generally the case, is carried home and built up into stacks, resembling those of Europe. The rice is not always grown on alluvial flats, and there is a variety, known as dry-soil rice, that is cultivated like any ordinary cereal. The sides of the hills are often laid out in a succession of gently sloping terraces, and planted with rice in drills running across the declivity, thus admitting of being irrigated by streams which, retarded at every step, move slowly forward without acquiring any impetus. The same mode of culture is also practised with other crops. In the north the crops principally consist of our ordinary cereals and legumes—wheat, barley, pease, and beans. Vegetables of various kinds are generally grown for household use. Varieties of the cabbage tribe are extensively cultivated for the sake of the oil extracted from the seeds. The raising of green crops to be plowed in as manure is generally common where rice is cultivated. Two kinds of plants are chiefly employed; one of them, a trefoil, grown on ridges similar to those which form the intervals in our celery beds. Among other crops regularly and extensively grown may be mentioned sugarcane, used chiefly in a green state; indigo; the castor-oil plant; and numerous plants grown for their roots. The opium poppy is now so extensively cultivated that there is a much smaller demand for the imported article than formerly. Maize, buckwheat, and tobacco may also be mentioned as cultivated crops. Three other plants of the greatest economical importance, and so extensively grown as to form important branches of Chinese agriculture, deserve a separate notice. The first is the mulberry. Judging from the quantity of raw silk annually exported, and the general use of silk for dress, especially by the wealthier classes of the country, it is evident that a large area must be appropriated to the cultivation of this tree, and millions of persons employed in the different processes connected with it. The plants are not allowed to exceed from four to six feet high, and are planted in rows, often along the banks of canals. The mulberry farms are small, and are generally worked by the farmer and his family. The Chinese silk is much heavier than the Italian, and preferred in fabrics requiring lustre and firmness. Whether it owes its quality to a particular variety of mulberry, or to the climate or soil, has not yet been definitely ascertained. The second plant more particularly deserving of notice is the cotton-plant. That cultivated in China is of the same species as the ordinary American, namely, *Gossypium herbaceum*. The plant producing the yellow cotton used in the manufacture of nankeen appears to be of a more stunted habit than the ordinary cotton. It is chiefly cultivated in a level tract around Shanghai, forming part of the Great Plain, and is the staple summer crop. The culture differs little from that of other cotton countries, more especially the cotton districts of India. The third plant, the tea-plant, is cultivated in two varieties—*Thea bohea* and *Thea viridis*; and though it was long supposed that the former only yielded black and the latter green tea, it is now known that both kinds of tea are obtained

from each. The great tea provinces are Kwang-Tung, Fu-Kien and Che-Kiang. In the first the *Thea bohea* is grown, and the tea is of inferior quality; in the other two the *Thea viridis*, which yields all the finer qualities, and furnishes the greater part of all that is exported to Europe. In these two provinces, where the culture is most extensive and carried to its highest perfection, the tea plantations are usually formed in a deep rich loam, never on the low lands, but on the low hilly slopes. The tea farms, as common throughout China in all kinds of culture, are small, and their management, including not merely all the steps of the culture of the plant, but the preparation of the leaves for market, is almost invariably confined to the farmer and his family. The leaves are gathered thrice—about the middle of April, when the leaf-buds are beginning to unfold; about a fortnight after, in the beginning of May, when the leaves are fully grown; and when the leaves again are newly formed. The first gathering yields the finest and most delicate tea, but with considerable injury to the plants.

Manufactures.—In all the arts necessary to the comfort of life, and in not a few of those conducive to luxury, the Chinese have made considerable progress. One peculiar feature in their processes is the general absence of machinery. Except in a few industries the great moving power is manual labor. The silk stuffs of China have long borne a high name, and in several qualities are still unsurpassed. The loom in common use is worked by two persons, one of whom sits on the top of the frame, where he pulls the treadles and assists in making the various changes which must be made on the machine while in operation. By means of it the workman can imitate almost any pattern. The crapes and flowered satins, and damasks for official dresses, manufactured by the Chinese are particularly excellent. Everybody wears silks. It is the prescribed attire of high officers; soldiers are not considered in full uniform without it. The finer kinds of it form the ordinary dresses of the opulent, while the poorest manage to deck themselves in a coarser quality, at least on gala days. The embroidery of silk is carried on to an amazing extent, the perfection to which it has been brought creating an almost unlimited demand, both domestic and foreign, and employing myriads of the inhabitants. Steam-power has latterly been utilized in the reeling and spinning of silk. In cotton goods the Chinese make good and substantial fabrics, but the cheapness and good appearance of the foreign goods have given rise to a large importation. Nankeen, once so common in Europe, is still produced as before, and continues to form an important branch of domestic manufacture. Cotton mills and factories of the European type have recently been established. Linen seems not to be made in China. Flax is not grown, but a good substitute for it is found in the fibres of two or three plants, especially ramee, from which the beautiful grass-cloth, similar in appearance to linen, is extensively woven. Woolen fabrics are made only to a very limited extent. The consumption of leather in China is not great, and the manufacture of it is very imperfect. The porcelain of China has been famous from the earliest periods. The manufacture of the finest forms of it being long known to the

CHINA

Chinese alone, gave them the monopoly of the world, and though in elegance of shape and design they must now yield the palm to Europe, for quality of material and rich gorgeous coloring they still hold perhaps the foremost place. Paper is an article that has been made in China from an early period and with great success. The manufacture of glass is not carried on to a great extent, and this is one of the few arts which, at least in regard to its finer processes, the Chinese have condescended to learn from Europeans. In beautiful lacquered ware the Chinese continue unsurpassed. Much of its excellence appears to be owing to the fine varnishes which they have learned to extract from native plants. Except in some few articles the Chinese are backward in the manufacture of metal goods; but recently, and under European leading, machinery, small arms and ordnance, warships, etc., are being produced in the country; as well as soap, matches, and other articles. Many small articles made by hand display much finish and delicacy of workmanship. See CHINESE ART.

Trade and Commerce.—The inland trade of China, aided by the unusual facilities which it derives from a system of water communication, ramifying like net-work over all its provinces, is of incalculable magnitude. Its rivers and canals are so covered with junks and barges and swarms of smaller boats, that there does not seem much exaggeration in the estimate which makes the tonnage belonging to the Chinese little short of the combined tonnage of all other nations. The inland commerce, however, is much hampered by the rarity of good roads.

By the opening of the principal ports the foreign commerce has been immensely increased. Till 1842 the trade with foreigners, exclusive of that carried on by the mainland through the town of Kiachta, with the Russians, was jealously restricted to the mouth of Canton River. By the Treaty of Nankin, in the above year, Hong Kong was ceded to Great Britain, and Canton and four other ports were thrown open, namely Amoy, Fu-Chau, Ningpo, and Shanghai. At subsequent dates other ports have been added to the list of treaty-ports for foreign commerce, and about 30 ports are now open, the most northern being Niu-Chwang, in Manchuria, and the farthest inland being Chung-King, on the upper Yang-tse, some 1,500 miles from the river's mouth. Steamers do not go higher at present than Ichang (1,100 miles), the trade above this being carried on by junks or other craft. Several other of the ports are on the Yang-tse. Of all the Chinese ports, Shanghai, at the mouth of the estuary of the Yang-tse, carries on much the largest trade. In 1902 China agreed to open five new treaty ports, Chang-Sha, Ngan-King, Wan-Hsien, Wai-Chau, and Kong-Mun. In 1900 the number of foreigners in all treaty ports was 16,811.

Among the countries which maintain commercial relations with the Chinese the principal are: Great Britain and her dependencies, Hong Kong and India; Japan, the United States, and Russia. The latest trustworthy statistics relating to the foreign commerce of China are set forth in a report for the year 1901 by Mr. J. W. Jamieson, British commercial attaché at Peking. He shows that from 1896, when it amounted to little more than \$270,000,000, it had increased by the close

of 1901 to about \$315,000,000, a gain of nearly \$45,000,000. To this total the imports contributed a little less than \$200,000,000. During that period, however, the imports from the United Kingdom fell off more than \$6,390,000, and the exports thither by nearly \$1,800,000. The trade with Hong Kong and India, on the other hand, increased, but the returns in relation to Hong Kong are deceptive, because large quantities of Chinese produce are sent thither from Canton and other ports in southern China for transshipment to other localities in the Middle Kingdom. Imports from the United States during the period named have increased by \$7,380,000, and the exports from China to the United States by upward of \$3,000,000. The imports from Japan have increased more than \$10,000,000 in five years. Imports from the United States in 1903 were valued at \$18,303,369; exports to the United States from China, \$20,583,068. The Japanese merchants are especially welcome in China. Those Japanese who have most to do with China, study not only the language, but also the ideas derived from Chinese literature. That knowledge of the Chinese educational system and of the ideas inherited through it has a value even in the sphere of commerce, the Russians have already recognized; the same insight and sagacity mark the course of Germany.

The Chinese, in carrying on their extensive dealings, domestic and foreign, have in all 24 weights and measures, but of these only 6 are in common use, namely, the liang or tael = $1\frac{1}{3}$ ounces avoirdupois; kin or catty = $1\frac{1}{3}$ pounds avoirdupois; and picul = $133\frac{1}{3}$ pounds, used in weighing bulky articles; and decimals of a tael, called mace or tsien, candareen or fan, and cash or le, used in reckoning bullion, gems, drugs, etc., 19 cash making 1 candareen, 10 candareens 1 mace. The only native coin now current is the cash, a small piece of thin circular copper about three quarters of an inch diameter, with a square hole in the middle for convenience of stringing. Native silver bullion, called *sycee*, and gold bullion of similar shape, and usually stamped with the names of the banker and workmen, and the year and district in which it is cast, are used in larger transactions. All taxes are paid in *sycee* of 98 per cent fineness. Private bankers are found in all large towns, and some of them pay interest on deposits. They issue paper money, which passes current in the particular districts where they are known. The Mexican dollar has been made a current coin all over the empire. In Shanghai, Tien-Tsin, Han-Kow, and the northern ports, the tael is commonly used.

Railroads.—Railway communication is as yet very limited in extent. The lines actually in working order in 1903 were as follows: Shanghai to Wu-Sung (built in 1898); Kai-Ping to Pe-Tang; from Tien-Tsin to within a short distance of the Great Wall, by way of Chan-Hai-Ouan, and with connection to Peking (built by Li Hung-Chang's advice; length 298 miles). Of lines conceded and projected since 1897, the list is as follows: (a) The Russian line through Manchuria, with branch to Port Arthur and Niu-Chwang (begun in 1897, to be completed in 1904; length of main line 1,200 miles, branch line 600 miles). (b) The German Kiao-Chau line (total length, 621 miles). (c) The Franco-Belgian line from Peking to Han-Kow

CHINA.

1. A Street in Tungchow.

2. Reception Hall of Temple.

CHINA

(the first line to be constructed by imperial decree). In the north, this line has been completed, and is in working order, as far as Pao-Ting-Fu, about 50 miles from Peking; in the direction of the Yang-tse the work has been completed as far as Sin-Yang, 120 miles from Han-Kow. The line will connect with Tai-Yuan-Fu and Singan-Fu. (d) The Anglo-German line from Tien-Tsin to Chin-Kiang with connections to Tsi-Nan; total is about 620 miles. (e) The English line from Tai-Yuan to Fu-Chau (298 miles); and two lines from Shanghai, one in the direction of Su-Chau, Chin-Kiang, and Nankin, the other to Hang-Chau and Ningpo. (f) The Belgium line from Canton to Han-Kow, with a junction at Hong Kong. (g) The French lines from Lavi-Kai to Yunnan-Fu from Lang-Son to Long-Chau and from Nan-ning-Fu to Peking.

People.—The Chinese belong to that variety of the human race which has been called Mongolian, but in them its harsher features, as represented in the genuine Tartars, are considerably softened. They are generally of low stature, have small hands and feet (the last often artificially made so small in the females as to become a deformity), an olive or yellowish complexion, much modified by the degree of its exposure to the open air, prominent cheek-bones, depressed nose, eyes obliquely turned upward at the outer extremities, black hair, scanty beard. In bodily strength they are far inferior to Europeans, but superior to most Asiatics, their great assiduity and patient endurance of fatigue making them highly prized as laborers throughout the Indian Archipelago. Perhaps the finest physical specimens of the race are to be seen among the coolies or porters of Canton. The Chinese are deficient in courage, yet often display great contempt for death. In their moral qualities there is much that is amiable. They are strongly attached to their homes, hold age in respect, toil hard for the support of their families, and in the interior, where the worst kind of foreign intercourse has not debased them, exhibit an unsophisticated and pleasing simplicity of manners. In the great mass these qualities are counterbalanced, or rather supplanted, by numerous vices—treachery, lying, gambling, opium-smoking, etc.

Population.—The Imperial treasury department of China has recently published an official census of China in connection with a readjustment of the imposts that are destined to pay its war indemnities. It appears from this census, that the empire contains 426,000,000 inhabitants, and that China Proper—with its 18 provinces—contains 407,000,000. In the provinces, the number of inhabitants per square mile is greatest in Ho-Nan and least in Kan-Su. In the dependencies the density of population is far less than in China Proper, especially in Mongolia and Turkestan, which are very sparsely populated. The density is 22 times greater in Ho-Nan than in Manchuria. The population of the United States as a whole is about 20 persons per square mile. The population of China Proper is about 300 per square mile. If the whole population of the United States and 40,000,000 more were crowded into the State of Texas the density of population would be about equal to that of the Yangtse Valley and of the plain extending north and south between the lower courses of the Yangtse and

the Hoang rivers. Ngan-Hui but a little larger than New York State has more than three times the population. Che-Kiang province, slightly less in area than Kentucky, has more than 10 times the number of inhabitants, and between Kwan-Tung and Kansas the ratio is 21 to one.

No census figures based upon official returns are obtainable for the dependencies, and the nature of the population in these regions makes even a close estimate difficult. The data for 1903 may be given approximately as follows:

China	407,330,000
Manchuria	8,500,000
Mongolia	2,580,000
Tibet	6,430,000
Sungaria	600,000
East Turkestan	600,000
<hr/>	
426,040,000	

Language and Literature.—The Chinese language belongs to those Asiatic languages commonly called monosyllabic, because each word is uttered by a single movement of the organs of speech, and expresses in itself a complete idea or thing. All Chinese words in the Peking tongue end either in a vowel, a diphthong (in which, however, each vowel sound is distinctly pronounced, making the word often to appear of more than one syllable), or a nasal. Of such simple words or roots there are about 450. But the accent of many of these words may be varied by the speaker in four or five different ways, so as to produce a corresponding variety in their meaning, by which means the number of simple words or roots amounts to about 1,200. The relations of words are ascertained by their position in a sentence. Hence Chinese grammar is solely syntax. Since many words similar in sound are different in signification, while in writing each idea has its peculiar symbol, the number of words represented by writing, without reckoning those peculiar to certain dialects, is perhaps 10 times greater than those distinguished by the ear. The number, in fact, is reckoned at 50,000. In writing and printing the characters are arranged in perpendicular columns, which follow one another from right to left. In its origin Chinese writing is hieroglyphic or picture-writing, with the addition of a limited number of symbolical and conventional signs; and anyone well acquainted with these symbols has obtained a good introduction to the reading or writing of Chinese. The larger number of Chinese characters are formed by the combination of such hieroglyphs and signs. But as one such character by itself seldom determines the sound, an additional word is conjoined for the purpose; so that the great mass of Chinese written words consists of an ideographic and a phonetic element. Native grammarians divide their characters into six classes.

The confusing variations in the forms used to represent Chinese proper names in English is an almost inevitable result of the characteristics of the former language. Uniformity seems at present almost impossible of attainment, but the practice of compounding geographical names in such a way as to bring into prominence the significance of certain often-used monosyllables has considerable to recommend it. For instance, "Fu" (or "Foo") added to the name of a place, as Ningpo-Fu, indicates a city ruled by an official directly responsible to the head of a pro-

CHINA

vincial government; that is, a city of the first class. In the form Ningpofu, the force of the compound is weakened. "Chau" (or "Chow") indicates a city of the second class; that is, a city subject to the ruler of a greater city; and "Hien" is used for a city of the third class; that is, a city of a dependent province. "Shan," meaning "mountain," is found in the name of the province Shan-Si ("Mountainous West"), Shan-Tung ("Mountain Province"), etc. "Kiang," meaning "stream," is found in the names of rivers, as Yang-tse-Kiang, Min-Kiang, Si-Kiang, etc. (the form Yang-tse-Kiang River being patently incorrect), and in the names of the provinces Kiang-Su, Kiang-Si, etc. In the case of names that have been longest known to the English-speaking world, or most frequently in use, such as Peking, Nankin, Shanghai, Ningpo, etc., although uniformity demands the compound form, the present form has been fixed by constant usage. Among other Chinese terms in general use in referring to places and institutions are the following:

Fu-tai, or Foo-tai, the governor of a province.

Godown, the place for storing goods.

Hai-kwan, the customs duties.

Hwang, emperor, yellow.

Li, a Chinese mile (equal to one quarter English mile).

Likin, an inland tax on foreign goods in transit.

Nui-Ko, privy council.

Shih, imperial.

Tael, a coin equal to one and a third ounces silver in weight.

Tao-tai, governor of a city.

Ting, a city of a small province.

Tsin, a prince.

Tsin-wang, a prince of the blood.

Tsung, clan, family (sometimes board).

Tsung-li-Yamen, a cabinet council of advisory powers having charge of official relations with foreigners.

Tsung-tuh, viceroy or ruler of more than one province.

Yamen, office (for official business).

The Chinese literature, from a geographical, ethnographical, and historical point of view, is unquestionably the most comprehensive and important of the whole of Asia. The printed catalogue of the Emperor Kien-Lung's library is composed of 122 volumes. In the five canonical or classical books, called 'King' are contained the oldest monuments of Chinese poetry, history, philosophy, and jurisprudence, some portions of which belong, perhaps, to the most ancient writings of the human race. Confucius, in the 6th century B.C., collected them from various sources, and in this collection they have been pretty faithfully handed down. In lyrical poetry the most distinguishing names are Li-tai-pe and Tu-Fu, both of whom flourished at the beginning of the 8th century A.D. The romantic poetry of the Chinese, though void of poetic beauty, is valuable for the insight it gives into their domestic life.

The art of making paper is said to have been known in the 1st century, and printing from wooden blocks, in the 7th or 8th century, hundreds of years before these valuable arts were invented in Europe. In China literary eminence is the sure avenue to the highest honors and offices of the state, appointments being

obtained by competitive examination; hence "the *litterati* are the gentry, the magistrates, the governors, the negotiators, the ministers of China." Naturally among the more comfortable classes, education of the kind which promises to be best rewarded is almost universal. For the lower classes also every village throughout the empire has its school, but the subjects taught are of the most elementary description; attendance is far from general, and is limited to the male sex. In 1898 an "Imperial University of China" was established at Peking. The first allowance for the building was \$112,000, and an allowance of \$150,000 is annually made for its support. The sciences, arts, and philosophy are included in the curriculum. Dr. William A. P. Martin, an American missionary and educator, was appointed first president of this institution, and three of its professors were from the United States. Students occasionally go abroad for study at foreign universities or technical schools. A few newspapers and periodicals are published in Chinese, especially at Hong Kong.

Religion.—Judging by the multitude of temples and joss-houses seen in every quarter, and the endless number of ritual acts performed on high festivals and in the ordinary intercourse of life, the Chinese are a most religious people. The religion of the state is Confucianism, an ethical system founded by Kong-Fu-Tse or Confucius, about 550 B.C. Another religion is Taoism, introduced about the same time by Lao-tsze, and numbering a good many adherents. (See CONFUCIUS, LAO-TSZE.) Among the great mass of the people a form of Buddhism prevails, or a curious mixture of religious ideas and forms. In the conduct of daily life they are under the dominion of innumerable superstitions, living in dread of demons whom they constantly endeavor to ward off or appease. Their belief in feng-shui, or the influence of "aspects," works against the introduction of railroads and other modern improvements. Attempts to introduce Christianity were made by the Nestorians as early as the 6th century, but the celebrity of the Jesuit missions has thrown all others into shade. The Roman Catholics now claim to have about 1,000,000 adherents among the Chinese. Various Protestant bodies carry on missionary operations in China. There are now probably over 50,000 native Protestants. During the Boxer massacres many native Christians were martyred.

Customs, Manners, Dress, etc.—Among the Chinese, politeness is carried to an extreme. They scrupulously avoid all contradiction in conversation, and are careful not to use any offensive or irritating expressions. From the same source arises the tedious, frivolous, and often absurd etiquette and extravagant compliment for which they are remarkable. But even here a wish to please and gratify is sufficiently evident. An invitation to dinner is written on a slip of red paper, and is sent some days before; it is usually in this style: "On the — day a trifling entertainment will await the light of your countenance; Tsau Sanwei's compliments." This is followed by another card naming the hour. The dinner itself is sumptuous, wine and spirits are drunk freely, and the whole affair goes off with a great deal of boisterous merriment. Fresh pork, fish, and fowls form the staple articles of food, with vegetables of various kinds. Beef and mutton are rare.

CHINA

Opium and tobacco are in common use. The usual beverage among all classes is tea, of which the Chinese consume enormous quantities.

In ordinary cases, strict separation prevails between the male and female branches of a household. Betrothment is entirely in the hands of the parents, and is conducted through the medium of a class of persons called *nei-jin*, or go-betweens, whose office of matchmaking is considered honorable. The marriage itself is conducted with much ceremony, gay processions, and other convivialities. Besides one wife, strictly so called, a man who can afford it may have several subordinate wives. A wife may be divorced on several grounds that we should deem frivolous. Infanticide is common among the very poor, the female children being almost the only victims.

The return of the new year is an occasion of unbounded festivity and hilarity in China, and New Year's Day is a universal holiday for rich and poor. At this season all accounts are expected to be adjusted, and if this is delayed or neglected the creditor has sometimes recourse to the expedient of carrying off his debtor's door. On New Year's morning all shops are shut, and this usually continues for several days. There are also various festivals throughout the year, but no weekly day of rest. Gambling is universal in China. Porters play by the wayside while waiting for employment; and hardly has the retinue of a great official seen the latter enter the house when they pull out their cards or dice and squat down to a game. Dress, like other things, undergoes its changes in China, and fashions alter there as well as elsewhere; but they are not as rapid or as striking as among European nations. Regarding dress, there are certain restrictive laws in operation. The mandarins or officials have some special peculiarities of dress, and their respective ranks are indicated by the nature of the knob or button they have on the top of their hats. The wearing of the queue or pig-tail is perhaps the most noticeable external peculiarity of the Chinese as regards costume. The headdress of married females is becoming, and even elegant. The copious black hair is bound upon the head in an oval-formed knot. No caps, bonnets, hoods, or veils are worn abroad; a light bamboo hat, or an umbrella, protects from the sun. The extraordinary practice, peculiar to China, of compressing the feet of females (especially those of the better class) into unnatural form and dimensions has been already alluded to.

Dwelling-houses are generally of one story. The common building materials are bricks, sifted earth, matting, or thatch for the walls, stone for the foundation, brick tiling for the roof, and wood for the inner work. The fronts present no opening but the door. The walls are often stuccoed, but not painted, and the bricks are occasionally rubbed smooth with stones, and the interstices pointed with fine cement. The general internal arrangement of a Chinese dwelling of the better sort is that of a series of rooms of different dimensions, separated and lighted by intervening courts, and accessible along a covered corridor, communicating with each, or by side passages leading through the courts. Streets are generally so narrow as to be mere lanes. The most characteristic Chinese structures are the pagodas, built

generally with a number of stories, each marked off from the rest by a peculiar projecting portion.

Government, Laws, Army, and Navy, etc.—The government is an absolute despotism. The emperor unites in his person the attributes of supreme magistrate and sovereign pontiff, and theoretically as "Heaven's Son" is to heaven alone accountable. In practice, however, the rigor of this despotism is considerably softened, and the greatest blot upon the Chinese administration is the corruption which in every form that ingenuity can devise is rampant throughout the empire. The emperor's principal ministers, four in number, two of whom are Manchus and two Chinese, form an interior council chamber, and beneath them are a number of assessors who form the principal council of state. The government business is distributed among seven boards, having cognizance respectively of the conduct of civil officers, of revenue, of rites and ceremonies, of military affairs, of naval affairs, of crime, and of public works. Another board, the Tsung-li-Yamen, has the charge of foreign affairs. There is, besides, an office of censors, 40 or 50 in number, who go out into the empire as imperial inspectors, and are privileged to make any remonstrance to the emperor without endangering their lives. The provinces, either singly or by twos, are under a governor and sub-governor, and each province has also a chief criminal judge and a treasurer. Particular magistrates preside over particular districts and cities, and instead of being permanent are changed about once in three years. The great object aimed at is to maintain a strict surveillance and mutual responsibility among all classes; in other words, to imbue them with fear of the government, and infuse a universal distrust. The chief protection of the people is in a body of laws, called *Ta-Tsing-Liuh-Li*, that is, "statutes and rescripts of the great pure dynasty" which are held in high regard, and agreeably to which, with occasional violations, all public functions are discharged. The new code of laws that is being drawn up for the Chinese empire is to be the work of a Japanese professor of law. The Chinese army has been subjected to a certain amount of reorganization in recent years, and an attempt has been made to introduce improvements from the European countries. In each important town there is a Manchu force, and the total Manchu army is estimated at 270,000 men, with an organization of its own. There is a Chinese army separately organized from this, forming a kind of militia, supposed to include some 800,000 men. A considerable number of the men are now armed with rifles of European pattern, and the European drill has been partially introduced. Li-Hung-Chang, when governor of Pe-chi-Li, organized a corps of instruction drilled and trained on the European model, and this comprises 10,000 men. Numbers of Krupp guns are mounted on the fortifications; and there are arsenals superintended by Europeans. The navy contains several cruisers and other war vessels of the modern type, but the Chinese lost their most powerful ships in the war with the Japanese, and their navy is now of comparatively little strength. Three protected cruisers were built in 1897 in Germany for the Chinese fleet, and several sea-going torpedo boats, ordered before the war, have been also added. The reve-

CHINA

nue of the empire is derived from customs, excise, and the land and salt taxes. Calculating on the basis of statistics for 1901, if the customs duties, including the sum payable in lieu of the *likin* or in land-transit dues, be computed at about 10 per cent, the revenue, if payable in gold, would be about \$20,000,000.

China had a national debt before the war of 1894-5, and at the close of that contest she assumed a new indebtedness of \$187,500,000. The aggregate indemnity which the foreign powers were to receive by way of indemnity for the Boxer outrages in 1900 was \$337,500,000, payable in 39 annual installments. The whole of the Chinese customs revenue, if payable in gold, would be equivalent to about 6 per cent of the indemnity.

History.—The early history of the Chinese is shrouded in fable, but it is certain that civilization had advanced much among them when it was only beginning to dawn on the nations of Europe. The names of numerous dynasties belonging to a period two or three thousand years before Christ are still preserved, but how much, if any, of this early history is authentic, cannot be determined. The Chow dynasty, which was founded by Wu Wang, and lasted from about 1100 B.C. to 255 B.C., is perhaps the earliest that can be regarded as historic, and even of it not much more is historic than the name. Wu Wang is said to have divided the kingdom into 22 feudal states, and the continual internal rivalries which resulted from this policy encouraged Tartar raids and invasions. Under Ling-Wang, one of the sovereigns of this dynasty, Confucius is said to have been born in 551 B.C. During the latter half of the period in which this line of sovereigns held control, there appear to have been a number of rival kings in China, who lived in strife with one another. Chow-siang Wang, who was the founder of the Tsin dynasty, attempted to bring all China under his rule, but he was unsuccessful. His great-grandson, however, a national hero of the Chinese, who was the first to assume the title of "Hoang" (emperor), and henceforth called himself Tsin-She-Hoang-Ti, succeeded in accomplishing this. He ascended the throne at the age of 13 and fixed his capital at what is now Segan-Fu. Besides building a great palace there, he constructed numerous roads, canals, and buildings, throughout the country. He completely defeated several Tartar and other neighboring tribes, and suppressed a revolt in his own country. The Great Wall of China was begun by his command, and it was he who ordered all books treating of the past history of China to be destroyed. The present name of China is derived from the name of this dynasty. The Tsin dynasty ended with Hoang-Ti's grandson, who gave way in 206 B.C. to Lew Pang or Kaou-Te, the founder of the Han dynasty. Toward the end of the 2d century, or soon after the beginning of the 3d century, of the Christian era, the empire was divided into three states, which were again united under one ruler before the end of the 3d century. During the 10th century the right to the throne was disputed, and civil war raged till an adjustment took place by the establishment of the Tsung dynasty under Tae-Tsu 960 A.D. Under this dynasty great progress was made in literature and art. Inroads of Tartar hordes now pressed the Chinese so hard that they called in the aid

of the Mongols or western Tartars, who freed them from their oppressors, but gave them a new master in the celebrated Kublai Khan who founded the Mongol dynasty, and removed the capital from Nankin to Peking. His ninth descendant was driven from the throne and a native dynasty called Ming again succeeded in 1368 in the person of Hungwu. A long period of peace ensued, but was broken about 1618, when the Manchus gained the ascendancy, and after a war of 27 years established the existing Tartar dynasty in the person of Tung-Tchi. According to the Chinese, their dynasties, 26 in number, embrace a period of about 5,000 years, during which between 200 and 300 sovereigns have held the throne. The earliest authentic accounts of China, published in Europe, are those of Marco Polo, who visited the country in the 13th century. The first British intercourse was attempted under Queen Elizabeth in 1596, but the vessel sent did not reach its destination. A trade was subsequently established at Canton by the East India Company, but no direct intercourse between the governments took place till the embassy of Lord Macartney in 1793, which was well received by the Emperor Keen Lung. A second embassy in 1816 by Lord Amherst, was treated with insolence, and returned with a letter from the emperor to the prince regent, bearing among other things, "I have sent thine ambassadors back to their own country without punishing them for the high crime they have committed." The arrogance thus manifested could not fail, sooner or later, to bring on a collision; and accordingly, in 1841, the British, on being refused redress for injuries, partly real and partly alleged, proceeded to hostilities, and after scattering almost without a struggle every force which was opposed to them, were preparing to lay siege to Nankin, when the Chinese found it necessary to sue for peace. A treaty was then concluded, by which the five ports of Canton, Amoy, Fu-Chau, Ningpo, and Shanghai were opened to British merchants, the island of Hong Kong ceded to the British in perpetuity, and the payment of \$21,000,000 agreed to be made by the Chinese. In 1850 an insurrection headed by Hung-seu-Tseuan or Tien-Te, who gave himself out as a descendant of the Ming dynasty, broke out in the provinces adjoining Canton, with the object of expelling the Chinese Tartar dynasty from the throne, as well as of restoring the ancient national religion of Shan-Ti, and of making Tien-Te the founder of a new dynasty, which he called that of Tae-Ping, or Universal Peace. After the capture and execution of Tien-Te his place was taken by Hong-Sin, who identified Shan-Ti with the God of Christianity, and regarded himself as called of God to make the old true religion of China again predominant. For a long period the insurgents succeeded in maintaining their ground against the imperial forces, and it was not till after the lapse of several years that the latter were enabled in some degree to quell the rebellion. Notwithstanding the cruel retaliation by the victorious party, and the wholesale massacres perpetrated on the insurgents, they were unable to stifle the spirit of revolt. In October 1856, the crew of a vessel belonging to Hong Kong were seized by the Chinese on the allegation that they had been concerned in a piratical attack on a Chinese vessel. The men, on the

CHINA

remonstrance of the British authorities, were afterward brought back, but all reparation or apology was refused. The attitude taken up by the Chinese in this matter led to a declaration of war, and in 1857 the Chinese fleet was almost totally destroyed, and Canton was taken by the French and English troops. A treaty was at length concluded with Lord Elgin on behalf of the British, by which important privileges were secured; but an attack on the French and English ambassadors who were on their way to Peking to have the treaty ratified by the emperor led to the renewal of the war. The allied forces marched toward Peking, and after twice defeating the Chinese troops entered the city. This brought the Chinese to their senses, and the treaty was ratified. Meantime the Tai-Ping rebellion had been gaining strength, and the trade of Shanghai and Canton was materially interfered with. The British thereupon decided to assist the Chinese in quelling the insurrection, and the services of a young engineer officer, Capt. Charles Gordon ("Chinese Gordon," afterward so well known in connection with the Sudan), were lent to the government for that purpose. The rebels were gradually driven from their posts, and in July 1864, Nankin, their last stronghold, was taken. But the empire was still disturbed by rebellion in other parts. The Mohammedans in Chinese Turkestan, wishing to take advantage of the weakness to which the Chinese government had been reduced by the Tai-Ping rebellion, revolted almost simultaneously, but apparently independently, with those in the province of Yunnan in the southwest. In both cases the rebellion resulted in the temporary separation of the provinces from the empire. In 1883 hostilities broke out between China and France in consequence of the warlike operations of the latter in Tonkin and her claim to the protectorate of the country; but the matter was arranged early in 1885. In 1894 war broke out with Japan in connection with Chinese misgovernment in Korea, and in this struggle Japan had almost an uninterrupted success both by land and sea, driving the Chinese out of Korea, and invading China at several points. Peace was concluded in 1895, China agreeing to give up Formosa and pay a large indemnity to Japan, to open additional ports to foreign commerce, and to recognize the independence of Korea. In the autumn of 1897 two German missionaries were murdered in the province of Shan-Tung, and the admiral commanding the German squadron on the China station immediately effected a landing in the bay of Kiaochau, which, after much discussion, was finally leased to Germany early in January 1898. This acquisition of Chinese territory by Germany attracted much attention among other powers whose interests were likely to be affected, and was followed at brief intervals by the leasing of the town and harbor of Port Arthur in the Liaotung Peninsula to Russia, and the leasing of the bay of Wei-hai-Wei to Great Britain. On 22 September, a *coup d'état* was effected by the dowager-empress of China, who had acted as guardian to the Emperor Kwang-Su during his minority, by which the emperor was again placed under her dominion. The prompt remonstrances of the representatives of the powers at Peking served to prevent any extreme procedure on the part of the empress and her advisers, and the emperor afterward nominally regained power,

but early in 1900 was reported to have abdicated.

In September 1899, Secretary Hay instructed the United States representatives in England, France, Germany, Russia, Italy, and Japan to invite from those governments a presentment of their intentions in regard to the treatment of the commerce of foreign powers in the newly acquired spheres of influence, with special reference to the treaties existing between China and the United States, advising that China be regarded as heretofore as an open market for the world's commerce, and that all possible steps be taken to establish much-needed administrative reforms and to preserve and strengthen the imperial government in its integrity. On 20 March 1900, Secretary Hay announced that all the powers concerned had accepted the proposals of the United States, and that he would consider their consent final and irrevocable. In May 1900, a secret society, colloquially known as the "Boxers," rose in the provinces of Shan-Tung and Pe-chi-Li and massacred native Christians and European missionaries. The Boxers were encouraged by the empress-dowager and the palace-party at Peking, who placed themselves at the head of a movement directed against foreigners. The ministers at the European legations in Peking—Sir Claude Macdonald being at the head of the British legation—determined to requisition guards for their protection, and these arrived on 31 May. On 4 June the Boxers destroyed the Peking-Tien-Tsin Railway, and by cutting communications isolated the Europeans in Peking. Soon after the chancellor of the Japanese legation and Baron von Ketteler, the German minister, were murdered in the streets. In hope of relieving the legations, Admiral Seymour put himself at the head of 2,000 European troops and blue-jackets, and set out from Tien-Tsin for Peking, but had to retire. Meanwhile the Chinese had been manning the Taku forts at the mouth of the Pei-Ho, and making preparations for closing the entrance to the river. The commanders of the allied fleets—British, French, Russian, and German—in the Gulf of Pe-chi-Li gave notice to the Chinese to desist. The Celestials in reply opened fire on the European vessels, 17 June, whereupon the allies bombarded and destroyed the forts. The allied forces entered the foreign city of Tien-Tsin on 23 June, and the native portion of the city was taken on 14 July. All this time the legations at Peking were closely besieged and constantly bombarded. The smaller legations having been destroyed or rendered untenable, their occupants, together with a number of native Christians, took refuge in the British legation, which, from its extent and strength, offered a better prospect of protection. The legation was ill supplied with provisions, and the defenders were reduced to extremities, when the relief force of 12,000 men comprising British, French, German, Russian, and Japanese troops, forced its way from Tien-Tsin, 15 August. Before the arrival of this force the empress-dowager and her court, with the Emperor Kwang-Su, had fled from the capital, and it was impossible, with the troops and transport available, to overtake them.

Troops of various nationalities had been despatched from Europe to North China with all possible haste, and Count von Waldersee, the

CHINA

German commander, had been accepted by all the allies as commander-in-chief, but international jealousies soon made themselves apparent, and complications seemed likely to ensue. In October 1900 it was announced that Lord Salisbury had concluded an agreement with Germany by which the two powers bound themselves to the principle of the "open door" in China, to abstain from seeking to obtain for themselves any territorial advantage, and to take such steps as might be agreed on for the protection of their interests, as against any other power seeking territorial aggrandizement. Subsequent military operations consisted chiefly of punitive expeditions to the south and west. Negotiations for peace were at once entered upon. On 4 December the powers sent a joint note to the Chinese peace commissioners, demanding among other acts, the execution of the leaders in the massacre of foreigners and the payment of an indemnity, which in October 1901, was fixed at \$735,000,000. On the ratification of the indemnity agreement, the foreign troops were withdrawn from Peking. Later, through the good offices of the United States, the indemnity was reduced, being fixed at \$337,500,000.

Events of 1902-3.—On 7 Jan. 1902, the imperial court returned to Peking, making a brilliant entry. The Europeans witnessed the pageant from the Chien-Men gate, the privilege being in contrast to the old rule under which no foreigner could see the passage of royalty through the streets. The empress after her return showed marked courtesies to the ladies of the foreign legations, introducing the innovation of receiving them in person. Four important edicts were issued on 10 January, placing political science and western arts among the subjects of study at the Hanlin Academy; creating Chang Po-Hsi minister of education, with instructions to draw up a new scheme of education; appointing Wang-Wen-Shao director of the board of railways and mines, and nominating Yuan-Shih-Kai director-general of the Peking-Shan-hai-Kwan Railway. Among other edicts was one urging the abandonment of foot-binding. On 12 February there was made public an Anglo-Japanese agreement. Its aim was the maintenance of the independence of China and Korea, and the prevention of territorial dismemberment. In a note sent to the other powers, by France and Russia, the two allied governments reserved "the right to consider, eventually, means of ensuring the defense of their own interests." The Manchurian convention between China and Russia was signed 8 April. Manchuria was therein acknowledged as an integral part of China, the right of sovereignty and of administration was restored (as before Russian occupation), and the period of the evacuation was reduced to 18 months, the withdrawal to be in six months after signature of the convention, and to be completed in successive removals from three specified portions of Manchuria. Russia also consented to restore conditionally the Shan-hai-Kwan, Niu-Chwang & Sin-min-Ting Railway. A rebellion in the south of China caused much disturbance, in the aim of founding a Chinese dynasty, in lieu of the present Manchu rule. The conflict between political and railway interests among the various powers concerned with concessions continued during the

summer. On 15 August, Tien-Tsin was formally restored to China. The protocol tariff agreed to by the powers was signed 29 August, and a scheme for abolishing "likin" (q.v.) throughout the empire was embodied in a commercial treaty with Great Britain, signed 5 September. On 8 October the Russians restored, but in form rather than in reality, the first portion of Manchuria named in the Manchurian Convention. In December it transpired that the German government had imposed upon China, as a condition of the former's consent to evacuate Shanghai, the promise not to grant any preferential rights opposed to the principle of the "open door," and also a stipulation that the forces of all the powers should evacuate the port simultaneously. The government of the United States had in November invited the powers to submit to The Hague tribunal the settlement of the question whether the war indemnity should be paid on a gold or on a silver basis, our State department alone, of all China's foreign creditors, showing disposition to relieve China from the additional burden imposed by any fall in the market value of silver, and the arrival of the period for the payment of the first installment of the indemnity, 1 Jan. 1903, made the question a serious one for the Chinese government. The final payments will be made in 1941. The delay of Russia in carrying out the convention provision regarding the evacuation of Manchuria became in the spring of 1903 a cause of international uneasiness, and the policy outlined by the czar's government regarding relations with China gave rise to so much inquiry and protest that an attempt was made by Russia to explain away her demands. The still occupied portions of Mukden and Kirin were, by the convention, to be evacuated in April, and the final and complete withdrawal from the province was to occur in July; but in spite of Admiral Alexieff's proclamation announcing that there had been a removal of troops on 23 April, an incessant activity after that date in railway development and transportation of supplies and ammunition, the building of barracks, and other signs of permanent occupation, tended to keep up the general distrust of Russia's intentions. The rebellious state of certain portions of the Chinese provinces during 1903, gave cause of serious anxiety to the viceroys, and their fear of anti-dynastic movements even led to the discountenancing of public meetings in Shanghai, called to urge government resistance to Russia's demands. The increased intercourse which has been manifested during the past few years between China and the western powers has tended to bring the vast population into closer touch with western ideas, and the question of to-day is no longer whether the Chinese will tolerate the presence of the foreigner, but which particular nation shall obtain the greatest privileges within the Celestial empire. The rivalry of the different powers concerned in the opening up of China is very keen, and the issue is yet undetermined. Great Britain desires to see the empire freely opened to all traders irrespective of nationality, while Russia and France aim at the acquisition of portions of Chinese territory for their own exclusive advantage. It is this conflict between a partition of China into spheres of influence and the maintenance of the empire in its full integrity,

CHINA AND JAPAN

while opening it up to foreign trade that occupies the attention of diplomats.

Chinese in America—It is estimated that there are about 100,000 Chinese in the United States, and that 30,000 of them are in San Francisco. There is a considerable Chinese colony in New York, and there are small colonies in Philadelphia, Boston, and Chicago. Though they do not belong to the educated classes, 95 per cent. of them can read and write. A daily paper in the Chinese language is published in San Francisco and another in New York.

Nearly all the Chinese in the United States come from the single province of Kwang Tung, the most populous of the eighteen provinces of the Chinese Empire. Its capital is Canton. Six counties of this province send out most of the emigrants to the United States. In 1900 an educated Chinese from the province of Shan Tung said that beside himself there were only two Chinese in the United States that came from any province in China other than Kwang Tung. The inhabitants of this province have for centuries been more adventurous and fonder of traveling than the rest of their fellow-countrymen, and they are always ready to face danger if there is a good chance of profit.

China and Japan. When in 1823 in response to the Russian ukase claiming exclusive possession of the Pacific coast of North America to the 51st parallel, John Adams told the Czar's minister, Baron de Toul, that "we should contest the right of Russia to any territorial establishment on this continent, and that we should assume distinctly the principle that the American continents are no longer subjects for any new European colonial establishments," he not only gave the first clear expression in action to the Monroe Doctrine (q.v.), but he unconsciously perhaps dictated the future history of the Pacific Ocean and in large measure the peaceful progress of China and Japan through American influences. Thus ushered into the world's politics, the United States, after resisting the Czar's demand and by diplomacy alone forcing it back to parallel No. 55, prevented the Russian advance southward in America, and

later gained California, Alaska and the Aleutians with a vast front on the Pacific, then whitened by our whaling and trading ships. Once California and Oregon ours, the incentive was quickly given to tap the markets of Asia and awaken the hermit nations to commerce. After Monroe, Fillmore. The latter, on the day that Mutsuhito, the present emperor of Japan, was born, 3 Nov. 1852, ordered Commodore M. C. Perry (q.v.) to proceed, by the shortest route—around the Cape of Good Hope—to Yedo Bay to negotiate a treaty. Perry's triumph was a "brain victory," won by tact, patience, and consummate knowledge of human nature and especially the Japanese variety of it. He opened a new era in the treatment of Oriental nations, showing how, apart from force, the door of international brotherhood might be opened. On the spot at Kurihama, where, in 1853, stood the pavilion for the reception of the President's letter, rises to-day in Perry Park the memorial monolith inscribed in gold by Marquis Ito (q.v.), to the erection of which the Mikado, leading his people, subscribed. At Yokohama, where the conferences of Commodore Perry and Professor Hayashi were held to discuss ethics, humanity, and treaty business, and the first industrial exhibition in Japan of American tools, inventions, and products was held, the United States consulate and the Union Church have been upreared. Thus led forward, the hermit Japan entered the school of experience whence she was to emerge as the pupil of the Anglo-Saxon nations and the champion of their principles in Asia, and the teacher of China and the middle term between the civilizations of the Orient and the Occident. After her own political commotions, consequent upon the clash of old and new ideas, Japan from 1870 engaged the service of hundreds, yes even thousands, of Yatoi (hired specialists) from America and Europe, to rebuild the foundations of the empire, and for 30 years besides sending thousands of her sons abroad, put herself under the tuition of an army of teachers from western countries who were active in every department. Yet what has been in phenomena true of Japan has been in the working of heaven true of China also, only her larger mass hindering the visibility of real progress. Perry's success with Japan really opened a new era in the whole Chinese world of eastern Asia. The spirit of America's commerce, education, diplomacy, missions, and the political policy of the United States have been the greatest factors not only in the awakening of China, but in influencing and regulating the policies of the aggressive European nations in their dealings with China and the neighbor nations of the Far East. Japan, contrary to popular notions, is a very young nation, being, according to the unanimous verdict of critical scholarship and all the evidence in hand, no older than the Germanic nations, coming to national self-consciousness in the 5th century of the Christian era. Naturally then she has taken quickly to western culture in the 19th, as in the 5th and 15th century. The Chinese, being an old race, with all the limitations of senility are more slow in their mental movements than the Japanese, who show all the peculiarities of a young race. Yet in both empires progress, through the combination of old and new forces, has been real.

Surveying the past fifty years and especially

CHINA AND JAPAN

what has been done within the 20th century, it is well to show still further wherein the Chinese and Japanese are alike or different from each other, and also wherever they have human traits in common and systems in harmony with or in contrast to the nations of the West. We may appraise changes actually wrought and see how far these movements or evolutions are to be attributed to agencies within or without these countries. There are those who consider Japan almost wholly a self-reformed nation, while others think that all transforming agencies have come from without. The truth lies in the golden mean between these extremes of opinion. China's vastness of area and density of population prevent even keen western observers and students and certainly the average Occidental, from any clear perception of leavening principles and transmuting elements within so large and venerable body politic. They may note what is phenomenal, while they are usually blind to the psychic changes in the Far East. Hence, for example, the real energies of the native secret societies and sects within the Chinese empire cannot be definitely gauged, yet that they have been for centuries a real force, frequently showing themselves in both bloodless and bloody manifestations, the last being the so-called Boxer insurrection of 1900, can be demonstrated. That these sects yet exist in great potency is certain. Until Western diplomats discern that China, equally with Turkey or Russia, and what survives of old Japan, is a church nation, with a fixed creed upheld by the government and maintained by force, and that China always has been, and is still, a persecuting nation, there can be no sound diplomacy. Failure to see this adds mystery to the Chinese problem and accounts largely for the discreditable surprise at the Boxer outbreak in 1900, foreseen by the missionaries, but to the approach of which so many diplomats in Peking were blind. This politico-ecclesiasticism based on the Confucian writings and philosophy, is the foundation of a social system that has survived the fall of over 30 imperial dynasties, and is still at once the most potent check upon and the choicest weapon of government, whether by pure Chinese or alien rulers like the present Manchus. Hence to attack that dogmatic system is treason in a native, a horrible offense in a foreign missionary, and only tolerable in the Mahometans because they are so numerous and powerful. The maintenance of this dogma by the sword of the normal magistrate, himself *ex officio* an orthodox Confucian, has been the cause of persecutions during the ages with bloodshed abundant. This is the real reason of so many reactions, and of repeated disappointments. China has again and again raised hopes among Occidental people that she was about to modernize her laws and people, only to dash the expectation of optimists to the ground. Even in this 20th century she has, after founding schools and universities, apparently on modern ideas, even appointing American and European officers and teachers, cast these persons aside, and neutralized their methods, ostensibly because natives or Japanese were preferred, but in reality to maintain her dogma of Confucian orthodoxy, because the decrees from Peking demand adherence to Confucianism. Whatever modifications China has made in her system are

as yet simply external, nor will there be any real progress in the western sense of the word until Chinese bigotry and persecution are abandoned and the union of church and state given up. The plea of China is that innovators under the pretext of progress are seditious and that reforms by natives mean republicanism and thus destruction of the dynasty. But this is only another phase of that Chinese indirection of mind, which Dr. Arthur Smith in his book on 'Chinese Characteristics' has so exposed with such masterly skill. The certainty of the Chinese union of church and state, the instances of bigotry and bloody persecution, and the great slaughter of Chinese in the name of orthodoxy during past ages, making the Chinese government a shedder of blood for opinion's sake, quite equal to Russia or the mediæval states of Christendom, are shown by that life-long scholar of Chinese, J. J. M. DeGroot of Leyden, in his monograph, 'Sectarianism and Religious Persecution in China.' In weight of scholarship based on original research this work outweighs all that has thus far been written on the subject of China's politico-religious status. In the future these sects will doubtless play a very important part, and probably with more effect on China's internal structure, than either the Tai Ping rebels or the "Boxers" (q.v.). Such possibilities must exist as long as China represses thought and opinion for conscience' sake by her absolutism in religious matters. Nor is it likely that she will find any better solvent for her problems than the complete separation of church and state and the granting, not only of academic freedom, but of perfect liberty of conscience to her people. So long as she refuses to grant such liberty, both in the school and to the masses, there will be no end to internal disorders and to foreign complications. In this matter of self-reformation, as the past has already proved, the elements tending to reconstruction and the evolution of the Chinese into the modern man are most likely to arise from among the natives who have been educated or helped by the teachers from foreign countries. The overwhelming majority of such men of modern mind are Christian, though others are far from lacking. Almost all the knowledge of China by the Western world comes from aliens, who have studied, surveyed, and described the country, and who in addition to propagating their dogmas have given the Chinese pretty nearly all the exact science they possess. One cannot ignore the services of those physicians, engineers, advisers, financiers, customs officers, who, with or without Chinese pay, have for a century or more served China's people. It was an American, Ward, who showed the possibilities of the Chinaman as a soldier. What other Americans have done in China is set forth in the book 'America in the East.' It was an American, S. R. Brown, 'A Maker of the New Orient,' for example, who established the first (Protestant) Christian school in China, brought the first Chinese students to America, and demonstrated the ability of the Chinese youth to absorb Western learning and methods. Among his pupils was Yung Wing, who, after graduating with honors from Yale College, brought to the United States under government patronage, six score Chinese lads as students, one of whom was Sir Liang Chang, the present Chinese envoy at Washing-

CHINA AND JAPAN

ton. In a word the efforts of the lay and clerical teachers, helpers, and healers of the Chinese, especially since the opening of the ports, and within the last 60 years, reveal a force that has, in the peaceful American, rather than the conquering Russian way, helped to give credibility to the prophecy of one of the greatest of China's foreign teachers, S. Wells Williams: "The regeneration of China will be accomplished like the operation of leaven in meal, without shivering the vessel."

The Japanese are not compacted wholly of Oriental stuff. They differ from the Chinese physically and psychically. Though they form a race having in it many elements, Tartar, Korean, Malay, Nigrito, etc., their basic aboriginal stock, the Aino, is very probably a branch of the Aryan family of humanity, and the Japanese are thus allied in some measure with the "white" races. In mind and temperament they differ from the Chinese, not only as insular people dwelling on volcanic soil constantly shaken by earthquakes, may be supposed to differ from continentals inhabiting stable lands in river valleys, but also in culture and aims. The Chinese are ethical, the Japanese esthetical. In China filial piety is the cornerstone of civilization, in Japan it is loyalty. The archipelago produced the samurai—soldier and scholar in one. The mainland generated the literati who despise the soldier. In Japan the centre and abiding element of all is the dynasty, one and unbroken during written history, for fifteen hundred years. In China the binding force is the social system, independent of figureheads in the capital, abiding through many changes of rulers but ever crowned by a religious system that tolerates no other and looking on all other cults as alien and dangerous. Even in old Japan we discern a church nation. Religion and politics though not nominally united were practically one, and bloody persecutions were far from unknown. Even yet the germs of fanaticism and persecution are not wholly eradicated though perhaps nearly so, nor can they be so long as academic freedom is curtailed or religion is in any way made an official engine of government. In the early ages of unwritten history the conquest of the primeval tribes of similar ethnic stock and of the Amos in Japan was by the force of the dogmas of Shintoism (the primitive religion or Divine Way) as well as by superior arms and valor. The Mikado was the regent and deputy of the gods of heaven and earth, and church and state were one. When Buddhism with its superior refining and elevating forces came to civilize the Japanese barbarians, this Aryan cult overshadowed Shinto, but was none the less the great breeder of action and reaction in the life of the nation. When its missionary activities ceased and the nation was Buddhized, Buddhism became itself the superior influence in politics, reducing the Mikado to a shadow, thus paralyzing the central authority, making the throne a mystery instead of a power. Buddhist monks organized as armies and not only overawed the emperor, but among warring feudal lords decided questions at issue even on the battlefield. Smitten down by Nobunaga (1533-82) and its power for a time curtailed, Buddhism was again patronized by Iyeyasu (1542-1616) in 1600 and made the popular religion, and its priests sent as sleuth hounds to

hunt down Christian believers. Roman Christianity was thus suppressed by the sword and ever vigilant inquisition. While the people were ruled by the bell of the bonze, the gentry and scholars who studied Confucianism and made it into a code of ethics, a philosophy and a creed, were given to understand that no departure from the official orthodoxy approved in Yedo would be tolerated. As matter of fact scores of executions of good men under the Yedo bureaucracy were brought about because of philosophical heterodoxy whenever and wherever associated with alleged sedition. It was in the name of the government, also, that imprisonment and death were denounced upon all who should believe in the "evil sect," or Christianity. When in 1868 the Mikado's government assumed supreme control of the empire (one of the powerful elements of the revolution being the revival of the ancient Shinto dogmas and ritual), the old death-dealing anti-Christian edicts were once more republished and enforced. Thousands of suspected Christians near Nagasaki were imprisoned and distributed all over the country. Under strong diplomatic pressure these prisoners were released. When the Japanese embassy in America and Europe saw themselves abhorred as uncivilized because of their persecuting tendencies, the edict boards were taken down. The natives were left free to organize churches and publicly propagate their Christian tenets and steady progress was made until in the constitution of 1889, full freedom of conscience was granted in the famous Article No. XXVIII.: "Japanese subjects shall, within limits not prejudicial to peace and order, and not antagonistic to their duties as subjects, enjoy freedom of religious belief." In his commentary on this article, the Marquis Ito, called the "Father of the Constitution," writes, "Freedom of conscience concerns the inner part of man and lies beyond the sphere of interference by the laws of the state."

Nevertheless, since there is no real liberty when conscience is bound or scholarship fettered, it is not yet true in Japan that perfect freedom of belief, writing and publication is openly allowed to any one in government pay. When in recent years a learned professor, examining the ancient literature showed that the use of Shinto (which was never formulated into a system or given its name until after the introduction of Buddhism) as an engine of government was not justified, and that the claims of the Mikado to a divine origin rested on very slender foundation, because lacking documentary proof, and that the whole system of ancestor worship was not a part of original Shinto, but was borrowed from China, he was punished by being put out of his position and retired on half pay. Yet, though academic and religious freedom is not absolute in Japan, it is relatively so full and generous, that it must serve as an increasingly powerful example to China, nor will China be rid of her manifold complicated difficulties with both natives and foreigners until such religious freedom, as is guaranteed to the Japanese in the fundamental law of the empire, be made the privilege of the Chinese also.

In so far as freedom in the deepest things affecting man is won and guaranteed, does other freedom follow. China's conceit of her theo-

CHINA AND JAPAN

retical perfection of government and of her own long supremacy among pupil nations prevented her from that recognition of the rights and privileges not only of other nations but of her own people. When a Chinese subject left the frontiers of his own country, he was ignored by his government and what happened to him abroad bred no concern at Peking. The Chinese rulers, to whom China's golden age was in the past, had no suspicion of any civilization superior to their own or knowledge of progress in other lands. To her court for ages had come only vassals or pupils, but in our day economic pressure from the outside, the Western men's desire for trade, the wars and aggressions of foreign countries compelled her to recognize merit and even superiority elsewhere, and gradually China began sending commissioners and embassies to other countries, the first modern instance being the appointment as Chinese envoy to the United States and European powers of the American, Anson Burlingame, who had won the confidence of the government at Peking. Much that was expected of this embassy failed to come to pass because the Western nations were probably as sturdy in their conceit as the Orientals and expected all changes in Asia to come by imitation of Western ideas and methods, whereas genuine international progress comes only by mutual influence. In 1868 the first real treaty made by China, in which the principles of the world's international law received recognition by the Chinese government was negotiated, when reciprocal privileges were granted to the two contracting powers, China and the United States. Mr. Burlingame negotiated other important treaties with Denmark, Sweden, Holland, and Prussia, but died in 1870, while arranging the terms of a treaty with Russia. We say "the world's" international law, for, so far from the name or the thing having originated in Europe, there was for centuries an international law in the Chinese world or orbit of influence in eastern Asia, governing the relations between the great central empire which occupied a position among subject and neighbor lands which the old Roman empire did in the western part of the Eurasian continent. The experience of this Far Eastern international law included such situations and episodes as the frequent despatch and reception of envoys of various grades and for many purposes, concerning which there was a fixed etiquette and a code of rules, the growth of centuries. Among the questions treated in these international communications are those of a "protected state," intervention, defensive and offensive alliances, treaties of peace, naturalization, the treatment of prisoners of war, rules in regard to pillage, even of places taken by assault, the protection or destruction of private or public property, the protection of exempted persons, especially women and priests, the guarding of the edifices of religion, art, and science, the respect due to messengers and bearers of flags of truce and concerning the instruments of war and means of destruction. One may thus easily see that Japan's hearty adoption of the modern laws of nations is no mere borrowing or imitation of things unknown, but that the diplomatic discipline of centuries enables her easily to keep equal step with the most highly civilized nations in those cour-

tesies and proprieties of which Christianity is the informing spirit. To these humane customs and usages Chinese, Japanese, and Korean history bears witness in hundreds of instances, but modern international law as formulated in the West received its initial recognition in China in 1868 under Burlingame. The epochal year of 1868 was the same in which Japan signed the treaties made with the Yedo shogun in the Mikado's name. Perry and Harris had treated with one who was only the Mikado's lieutenant at Yedo, but taught in the new school of international law by the American envoys the men who made the new government at Kioto formally adopted the principles of the laws of nations, and in frank acceptance of these principles began to relay the foundations of the empire, besides adopting representative government and civilized customs generally. When therefore the first great occasion arose between the two Asiatic states and always jealous nations, Japan and China, a still further development took place. Especially in the classic instances of the Peruvian ship *Maria Luz* in 1872, and the invasion of Formosa by the Japanese in 1873, was this seen. The Japanese government, having made inquiry into a cargo consigned to Callao, which was a human freight of Chinese laborers from Macao and held against their will, released the coolies and shipped them to China, a favor which was gratefully acknowledged by the Peking government. The so-called pagan nation of Japan achieved a great moral victory in breaking up a certain kind of slave trade which by euphemism was called the coolie traffic, while the very act shamed China into taking better care of her people. The results were soon manifest. For the first time China sent out commissioners to look after her own subjects in foreign lands, and her envoy going to Cuba and Peru refused to enter into treaty obligations with any South American state as long as a single Chinaman remained in the country against his will. Despite all protests of foreign consuls and ministers the Japanese persevered. Having freed their own *eta* or *pariahs*, they liberated the Chinese slaves in their own waters. This was the beginning of the establishment of Chinese consulates and legations throughout the world. To-day we find the Chinese increasingly social. The once hermit is in the world's market-place. The Middle Kingdom is represented in the Universal Expositions. Whereas it has been the rigid rule that a prince of the imperial blood must never spend a night outside Peking, we find, in 1904, the heir apparent to the throne, Prince Pu Lun, traveling in America. In 1874 after the wreck of a Riu Kiu junk on the coast of Formosa and the killing of the crew by the head-hunters, Soyeshima, the Mikado's minister, went to Peking and received audience with the Chinese emperor, standing upright though dressed in Western costume. He obtained from the Tsung-li Yamen the disavowal of responsibility over Eastern Formosa to which China laid no claim, and from the maps of which country it was omitted. Nevertheless after the interview, and when 1,300 Japanese soldiers had occupied Formosa for six months and chastised the savages, the mandarins of the capital, incited by foreign influence in Peking, awoke in wrath and shame, declared the Japanese intruders and menaced the island empire with

CHINA AND JAPAN

hostilities. Okubo (q.v.), sent by the Mikado to Peking, refused to treat in the matter except on the basis of international law. By this, war was averted and henceforth the world's legal standard was appealed to in all matters relating to Riu Kiu, Korea, and other questions in dispute, but with a tendency on the part of China to relapse into old tradition and custom, not being able to forget that she was no longer the "Middle" Kingdom. For example, the Chinese emperor Shunchi (1644-61) had written, "But now all lands both Middle (that is, China itself) and foreign, have become united into one vast empire, so that the whole earth has become one family and all the people of foreign countries are my children." When, therefore, Japan in 1870 occupied the Riu Kiu Islands and abolished their dual sovereignty, China protested, though not until 1874, and then in language of an exceedingly undiplomatic nature. After a long and somewhat acrid diplomatic correspondence, the controversy reached a dead-lock, when in the summer of 1879 Gen. U. S. Grant visited Peking. Prince Kung placing the matter before the American ex-President, bespoke the latter's assistance. This eminent American refused to pronounce any opinion on the merits of the case, but on his arrival in Japan, proposed unofficially to the Mikado's ministers a solution, and advised the Chinese government to withdraw their offensive despatches and appoint special commissions with full power to settle the matter. This proposal was accepted. An imperial commission was created by the Mikado's proclamation, and Mr. Shi-hido was appointed plenipotentiary commissioner to treat with Prince Kung and the ministers of the Tsung-li Yamen, the conference beginning its sittings on 15 Aug 1880. The draft of the treaty was finished on 2 October, but the caprices of Chinese statesmanship were then beyond the range of ordinary prescience, and the action of the Peking government showed that they did not yet understand fully the meaning of the term "plenipotentiary commissioners." After 26 days' delay, 16 of them being after the date fixed for the signatures to the treaty, the matter was taken out of the hands of the high commissioners and transferred to the northern and southern superintendents of trade. This action turned the whole affair into mockery and began in the Japanese that sense of outrage which made them prepare for the possibilities of war, especially as the question of Korea (q.v.) was still unsettled.

In 1876, three years before, Japan had made a treaty with Korea as an independent state, which precedent, curious as it may seem, China assisted the United States, through Admiral Shufelt to follow, looking complacently on also while other nations, England, France, etc., did the same, each treating Korea as a sovereign and independent state. Nevertheless, while the notion of a vassal state's acknowledgment of dual sovereignty was unknown in the West, it still existed in the Chinese mind and the Middle Kingdom gave no sign of yielding her hold upon Korea as a vassal state. There seems little doubt then, that by 1880, the intelligent statesmen of Japan foresaw and the Japanese military men prepared for a war with China. Events and experiences in Korea during the next 14 years served but to change a suspicion into a determination.

When in 1894, this war broke out, it was evident that both nations had made vast progress in both material civilization, and in those gains which are associated with the triumph of mind in law and morals, revealing clearly by startling contrast both the homogeneity and thoroughness of the progress of the smaller and the looseness of organization in the larger country. Japan, quickly responsive to a central will, seemed like an athlete in possession of all his powers, while on the other hand there was with "the boneless giant" progress only in lines and spots, the work of partially modernizing China having been chiefly that of a few resolute men, while the great body politic seemed to be insensitive, and vigorous for offence and defence only in portions. Strictly speaking, there never was any war between Japan and China, but only a war between all Japan and a few of the maritime provinces of China. The American, Ward, and the Englishman, Gordon, had shown what the average Chinaman could make of himself as a soldier, when properly drilled, commanded and influenced by example. Under these men, Li Hung Chang (q.v.) was converted to the value of the material forces in Western civilization. Adopting these, and being viceroy of provinces nearest to the capital, he organized an army drilled by German officers, and had the promontories of Wei-hai-wei and Port Arthur, guarding the sea gates of the capital, fortified and the Taku forts commanding the Pei-ho River rebuilt according to modern principles of defence and engineering. Gradually an efficient fleet of battleships, cruisers, and gunboats was organized. A beginning had also been made in China of railways and steamship lines. One part of China's vast system of revenue, "the imperial customs" of the empire, elaborated since 1863 under the British Sir Robert Hart, and honestly administered, has given China her surest source of cash income for general purposes and the purchase of foreign equipment of every sort. For an individual or government service to be free from bribery and routine corruption seems to the normal Chinaman something unearthly, and the imperial customs under Sir Robert Hart have won unbounded admiration from the Chinese. In 1894, when the war broke out which did so much to prick the bubble of Chinese prestige of greatness and mass, and which, paradoxical as it may seem, evoked mutual respect and drew the Chinese and Japanese more closely together in reciprocal understanding, China had, in addition to her military mobs in the various provinces, the beginnings of scientific military system. This in time might have become national. Even then as seen to undiscerning foreigners China appeared from a military point of view invincible. On the humane side of provision for sick and wounded soldiers and in the nobler features of civilization, China was woefully deficient. As soon as hostilities broke out the vast difference between the two nations was manifest. China went to war without surgeons, hospitals, nurses, or the manifold apparatus of civilization for protecting non-combatants, saving life and mitigating the horrors of war. China had not yet become a signatory to any of those conventions of nations in the interests of mercy, nor was there a Red Cross organization within her borders. Her recognition of the international code of war was

CHINA AND JAPAN

slow and her acceptance of it slight. On the contrary Japan, having her object lessons given by Christian missionaries had provided hospitals, surgeons, Red Cross Society and equipments for surgery, healing and hygiene, and these were in splendid condition, while 1,400 trained nurses were ready for work. Japan had in 1887 signed the Geneva and other conventions and had diligently educated her army officers in the commentaries and usages of the signatory nations, while her naval commanders were well versed in the laws of search and capture. When in 1894 her fleets and armies went forth into Korea, Manchuria, and China proper, there was with each field-marshal, besides a hospital corps ready to minister to friend or foe, an expert lawyer, versed in international law, who went as adviser to see that nothing was done by the Japanese which should infringe the laws of nations. Two notable books, 'International Law During the Chino-Japanese War,' by S. Takahashi, and 'La Guerre Sino-Japonaise au Point du Vue du Droit Internationale,' by Professor N. Ariga, the one from the military and the other from the naval college in Tokio, are the literary monuments of this habit of the Japanese, which, in 1904, has developed into a college of five international law experts. These, after being consulted at all points during the progress of the negotiations of 1903-4, have gone upon deck and field with the military and naval men into Manchuria to insure, in every detail, harmony with the laws of nations.

The war of 1894-5, which wrought such great results for the world at large, is worth reviewing in its main outlines, since it blew to pieces and forever China's doctrine of Whang-ti, or world-sovereignty, the tenacious adherence to which over Korea had brought on the war. After being again served by China as they had been in the Riu Kiu matter, the Japanese determined to take no further chances with her rulers. In Korea, after the bloody struggle in Seoul between the native Liberals and Reactionaries in 1884, followed by the armed conflict between the Japanese and Chinese troops, a convention was made dated 7 May 1885 between Li Hung Chang and the Marquis Ito, that both governments withdrawing their troops, would not again land soldiers in Korea without mutual agreement. For awhile there was peace in the Land of Morning Calm, but when the Tong Hak uprising took place, the soldiers from Seoul were overcome and the whole kingdom seemed to be in danger of anarchy, the pro-Chinese faction at court asked for aid from Peking to put down the rebels. Then to the amazement of the world the Chinese government violated the treaty of 1885 by first forwarding troops and then notifying the Japanese minister in Peking, using the words "our tributary state" concerning Korea. China thus reasserted her ancient claim of suzerainty over Korea as a vassal state, notwithstanding that Korea had been recognized as sovereign and independent by Japan and other nations. The government in Tokio interpreting this as a direct insult, on 12 June 1894 announced the despatch of a body of troops under strict discipline to Seoul and five days later invited China to undertake with Japan financial and administrative reforms in Korea in order to preserve the peace of the Far East. The Peking government

curtly refused and demanded the recall of the Japanese troops. The reply from Tokio was that pending an amicable settlement of questions in dispute, any further despatch of Chinese forces into Korea would mean war. China had already ordered her soldiers in Manchuria to cross the Yalu River, and having chartered the British ship Kow-Shing despatched 1,100 soldiers to reinforce the Chinese camp at Asan in Korea.

What follows the world knows. With astonishing secrecy and celerity, the armies of Japan occupied Korea and after the decisive battle of Ping Yang drove the Chinese out of the peninsula, crossed the Yalu and in Manchuria conquered an area larger than their own empire, while her navies wiped the Chinese fleet off the ocean and captured the great fortresses of Port Arthur and Wei-hai-wei. After annihilating nearly all the drilled troops of China at Ping Yang, the Japanese fought military mobs, making war chiefly with the forces of only a portion of the empire. During the war the majority of the Chinese people scarcely knew that there was any real hostilities adverse to their empire, nor did they learn for years afterward just what had happened, but the military success of Japan opened the eyes of Europe and enlightened some of the Chinese mandarins and scholars. To-day we find China with a new army, formed on modern principles and drilled chiefly by Japanese officers, while in June 1904, having become a signatory to the Geneva and other conventions made to mitigate the horrors of war, she has entered still the pale of civilization, which means the world in brotherhood.

The Japanese stung to the quick, because neither China nor Western nations had recognized them as highly civilized people, were confirmed in their pride and resolve to make the so-called white race understand and appreciate them, when Russia, France, and Germany joining to deprive them of the lawful fruits of conquest, forcibly compelled them to be satisfied with the cession of Formosa and indemnity in money. Had the Japanese been possessed of four battleships, they would in 1895 have declared war against Russia. As it was, they who never forgive an insult, resolved to nurse their wrath, keep it hot by buying battleships, and in cool science and unwearied perseverance began to invent explosive powders, perfect munitions and equipments and enlarge an army and a fleet that should some day wipe out the insult, and show that the Japanese count none on earth as their superiors. Meanwhile China, profiting by her fresh experience in humiliation, began to inquire more earnestly into the secrets of Western power. A tremendous impetus was given to the reading of all kinds of information about Japan and the Western nations, to the building of railroads and to the renovation of educational methods. The ferment of ideas caused something like a great reform movement in 1897, which, led by progressive literati and apparently sanctioned and even controlled by the young emperor, seemed apparently about to sweep over the whole empire. New schools and universities were planned and a newspaper called 'Chinese Progress' was published. The purchase and sale of official rank was to be abolished. The stirring and patriotic brochure 'China's Only Hope,' recommended

CHINA AND JAPAN

by the emperor, fed the flaming zeal of the reformers who were led by Kang Yu Wei. Even the abolition of the queue, the changing of the Chinese national dress, the adoption of the Christian religion, the calling of a national parliament and a journey of the emperor and empress dowager to Japan to see for themselves the pitiful condition of China were advocated in memorials. Reform seemed to be ready to spread like a prairie fire, when suddenly in September, Li Hung Chang was dismissed from office and the emperor virtually dethroned by the Empress Dowager. This act "carried within itself the fruitful seeds of the Boxer outbreak." Yet although the missionaries felt what was in the air, the diplomats looked on the episode as a "Manchu family quarrel," and ignored the warnings of those living close to the masses of the people.

Meanwhile the disturbing influence of American prosperity and expansion were felt in both Europe and Asia. Within a year after Pittsburg achieved the supremacy of the world in the making of cheap steel, Russia, Germany and Great Britain "precipitated themselves upon the shore of the Yellow Sea, grasping at the positions which had been conquered by Japan and for the same reason,"—to obtain possession of the rich coal and iron deposits in Shansi, said to be "worth ten Pennsylvanias." Germany seized Kiao Chau, Russia Port Arthur and Great Britain Wei-hai-wei, in readiness for the supposed impending "Break-up of China" and its expected partition. The torpedo that sunk the Maine in Havana harbor interrupted the European programme, postponed the partition of China, and united the British, Americans and Japanese in the determination to keep China intact and the door of commerce open. In 1900 the United States, now a world power, was in Asia with force and had a policy—the policy of freedom and uplift—which for a century or more, the Americans in Asia, as traders, teachers, healers, and apostles of democracy and fair play had been steadily developing. Meanwhile in China the old territorial integrity could not be so ruthlessly violated nor the ancient social systems invaded without protest. The introduction of railways had thrown thousands of men out of old methods of employment. The tremendous commercial intrusions, which disarranged old customs and made the problem of livelihood to millions so very serious, brought on a fierce reaction both of the scholars and the people and especially of the Buddhist priests, creating an atmosphere and environment most favorable for the outbreak of another of those sectarian revolts against the official orthodoxy of China, to put down which the Chinese have shed more blood perhaps, than all the religious wars and inquisitions of Europe. This time the heresy was joined with and the cry raised in the name of patriotism. The heretics became the people called "Boxers" or the Fists of United Harmony. The triple pressure of hunger, superstition and patriotic revolt at the territorial incursions of the foreigner at last burst out into a storm, which in blind wrath against everything alien, smote first the railways and foreign workmen and then the teachers of the foreign religion and their converts. The mob reached Peking and surrounded the legations, which were hastily isolated, fortified and for months

successfully defended. The foreign powers hastily made preparation to defend and then succor their nationals, but the United States seemed to be the only one that beside its prompt despatch of a military force had a definite policy, which was in recognition of the sovereignty of China to relieve its own citizens and then withdraw its military from Chinese soil. It is absurd to suppose any real harmony or co-operation between the orthodox Chinese government and the heretical Boxers. Whatever be one's opinions on the subject or the form of the encouragement alleged to have been given directly by the Empress Dowager, it is a fact that no hostile shot was fired by a Chinese regular soldier or sailor, until the seven allied nations, in which the Americans were not included, had made war on China by firing on the Taku forts, 17 June 1900. Against this unwarranted proceeding and overt act of war the American Admiral Lewis Kempff protested, and in the crime of attacking peaceful Chinese he refused to participate, his conduct becoming the basis of the triumphal diplomatic policy of the United States government. Briefly stated, the situation was this: A riot of fanatical sectarians, moved by economic and patriotic motives, rose in rebellion against the government already impoverished and weakened by foreign aggression. When unable to put down the uprising in Shan-si, the Pei-ho valley and the vice-royalty from which Li Hung Chang had been removed—though the whole Boxer movement was wisely handled and thoroughly suppressed by able viceroys in the central and southern parts of China—the seven allied nations made war on China in the bombardment of the Chinese forts. When also the Chinese, of course, attacked their enemies in Siberia, the Russians perpetrated the massacre at Blagovestchenk and then marched their soldiers to Peking. The combined relieving force fought the opposing Chinese. The Japanese, having the largest and best furnished of the contingents, led the van. The Russians as very slow marchers came next, so that the American and British contingents had to march during the hottest hours of the day. It is certain that the celerity, character and discipline of the Japanese soldiery on this expedition excited the surprise and admiration of military critics of every nation represented, while on the other hand the familiarity of the men of Nippon with those of Muscovy bred contempt of Russian slowness, heaviness and low grade of intelligence in the *mujik* or common soldier of the czar.

After the capture of Tientsin 14 July, the Japanese or Americans alone could then have pressed on and relieved Peking within a fortnight, but jealousies and unnecessary delays kept the relieving column idle until 4 August. The unspeakable robberies, violation of women, brutalities and generally barbarous conduct of the most of the European troops, by the way and in the capital, demonstrated the hypocrisy of the claim to be called Christian and in contrast to the conduct of the Japanese proved that the terms "Oriental" and "Occidental," as applied to morals, are purely traditional and destined soon to pass away. The Imperial city was captured on 15 August, the Chinese court escaping to the westward and remaining away from Peking until January 1902. On 28 August bodies of soldiers, representative of the

CHINA AND JAPAN

eight allied nations, marched through the Forbidden City as a token of China's humiliation. Li Hung Chang was recalled to office and with Prince Chang commissioned to treat with the Powers, only one of whom, the United States, seemed to have a definite policy. During the "peace" negotiations, the Europeans kept up a series of attacks and massacres of Chinese called "punitive expeditions" which in general character were a disgrace to civilization. An indemnity equal to \$330,000,000 was imposed on the Chinese government in expiation of the Boxer outrages, and for her self defence in the war following the attack on the Taku forts. Various safeguards for the legations were arranged and agreed to, the importation of arms and ammunition prohibited, and the Tsung-li Yamen was transformed into the Ministry of Foreign Affairs which was to take precedence of the other ministries. Except legation guards, the foreign troops were to be withdrawn in September 1901. The Imperial edict of February 1901 accepted the terms imposed. On 9 April 1902, the Manchurian convention between China and Russia received the imperial seal. The Russians were to evacuate Manchuria within eighteen months, but to retain control over the railroads.

It was after this Boxer uprising that what we have called the Russian and the American foreign policies and systems of diplomacy had by contrast their most signal illustration. As soon as order was restored and the preliminary diplomatic arrangements made, the United States recalled all its military force, except a small legation guard, asked no favors in return for what had been done, and not only emphasized her recognition of China as a sovereign Power, but set a commendable example to the other governments by dealing justly with the Chinese in the matter and method of payment of the indemnity, thus illustrating again the fixed American policy of helping rather than taking advantage of Asiatic nations. Russians, on the contrary, demanding the right to occupy Manchuria with her troops and to make Port Arthur the terminal of her Siberian railway, began thenceforth the military possession of Manchuria, the building of the city of Dalny (q.v.), and the making of Port Arthur (q.v.) both a city and an impregnable fortress, and initiated various other enterprises on a vast scale, costing hundreds of millions of roubles, all of which suggested a prospective ownership in fee simple, rather than temporary occupation, notwithstanding that she solemnly covenanted to evacuate on the 8th of October 1903. The United States believing in the good faith of the Muscovite government and in accordance with her policy of recognizing China's sovereignty, appointed consuls for the three cities in Manchuria which by treaty agreement were to be thrown open to the trade of the United States. When the appointed time drew near, there was no indication of any purpose on the part of Russia to keep her agreement. As early as 28 July 1903, the Japanese government expressed to Russia its alarm at the Manchurian situation. When Russia formulated new demands at Peking and seemed to consolidate rather than relax her hold on Manchuria, showing also increased activity along the Korean frontier, doubts were raised in Tokio as to the limits of Russia's ambition. Through his minister in

Tokio, Baron Komura and his envoy, Mr. Kurino in Saint Petersburg, the Mikado notified the Czar through Count Lamsdorff that wishing to remove every cause of future misunderstanding he desired to enter "upon examination of the condition of affairs in the Extreme East, where their interests meet, with a view to a definition of their respective special interests in those regions." Negotiations were opened and after long delay on the part of Russia the Czar announced that while willing to respect the independence and territorial integrity of Korea, Russia declined to extend the same engagement to China and requested Japan to acknowledge Manchuria and its littoral as entirely outside her sphere of interest. The Czar furthermore requested the limitation of Japanese control in Korea, even proposing a mutual zone covering all Korean territory north of the 39th parallel. Other negotiations, followed by exasperating delays in Saint Petersburg, took place, Russia meanwhile heavily reinforcing both her army in Manchuria and her fleet in eastern seas, purchasing and transporting also large stores of ammunition and coal to Port Arthur. On the 5th of February, Japan telegraphed the termination of her negotiations, severing diplomatic relations with Russia and withdrawing her legation. Then followed hostilities, begun simultaneously, both parties claiming that the other had fired the first hostile shot. In the war that followed, the Japanese surprised Europe with the rapidity and brilliancy of their victories on land and sea, China remaining neutral except to take precautions against the violation of her frontiers. At the request of the German Emperor, the American secretary of state urged upon three of the nations most interested, the limitation of the area of hostilities, to which they promptly responded. From the side of the Japanese it must be remembered that they were smarting under the sense of long-continued Russian aggression in Saghalien and the Kuriles, begun very early in the 19th century. In 1861 a Russian man-of-war proceeded to the island of Tsushima, on which the Russian flag was hoisted and a settlement was made (though not until Japanese blood had been shed in resistance), which would have constituted a title of ownership had not Great Britain interfered. The Russians were finally compelled through British intervention to abandon their claim and leave. By the usual plan of "joint occupation," which in the Ussuri province of the Chinese empire had ended in China's loss of a territory as large as France and its incorporation into the Russian empire, the Russians gained complete possession of Saghalien. After the restoration of the Empire in 1868 it was foreseen by the Japanese statesmen that Russia would be their chief danger, for already signs of her movement in Korea were menacing. This fact was the strongest determining element in the creation in 1871, in place of the old clan contingents, of a powerful army and navy for national defence.

It is more than probable, as history has clearly shown in the past and as the racial constitutions intimate, that progress in Japan and China will proceed from varying levels and in different channels. In the island Empire the centre of national life is in the one unchanging dynasty and national amelioration has issued from the government downward. Any sure advance for Japan in the future will be from the

CHINA DECORATION

same source and in a similar direction. On the contrary among the Chinese people, to whom the existence of this or that dynasty makes no vital difference, reform will arise in and proceed through their social system and not from throne or court. In China real and permanent progress has been less through anything done in Peking than directly traceable to the work of men who rose from the people and who had been instructed by foreign diplomatists, teachers or missionaries. These men have trained the people through the schools, the press, the churches and the hospitals, reaching all parts of the empire by means of the printed word, book, tract, newspaper, or by personal influence upon China's leading men, whether in or out of office. In Japan before Perry's advent there were hundreds of men already enlightened, keeping eye on European aggression in Asia, and moving for the unification and reform of the nation. The great motive supplying the force of their lives came from no foreigner but from their own inborn patriotism and self sacrifice. Nevertheless, when fullest credit is given to the propulsive power of her Bushido, or the Knightly Code, it must be remembered that Japan, after her first contact with Europe, never was truly a hermit nation. For two hundred years or more the Dutch at Nagasaki fertilized the Japanese mind, keeping open not only the door of outlook on and information from Europe, but nourishing the Japanese intellect with exact science, varied knowledge and the applications of occidental methods especially in medicine and the mechanical arts. In 1853 it was strenuously charged by the Conservatives who wished the country kept shut that only the native "Dutch scholars" wanted the empire opened to commerce and western influences. In 1868 when the men rich in Dutch culture and the "Mikado-reverencers" gained possession of the imperial person in Kioto, they began to relay the foundations of the empire by seeking for knowledge in every part of the world. Teachers, advisers, engineers and experts of all sorts were imported by the hundreds, who during thirty-five years have literally taken off their coats and, by example and teaching, re-draft and handicraft have shown the Japanese how to do those very things which they are now doing so well. The configuration of the Japanese Islands has fitted them to profit to an extraordinary degree by the adoption of the forces of steam and electric communication at a time most needed, that is, immediately after the abolition of feudalism and in the transit to industrialism helping to unify them politically and consolidate them into a marvelously compact nation. In China, railways will re-distribute into wholesome evenness of proportions of table-land and littoral, the population now congested in the river valleys and alluvial plains, will develop and distribute the wealth of the mines, will abolish the almost periodical famines, and by adding healthy movement and contact of the inhabitants of distant provinces develop in the Chinese that patriotism (as distinct from race pride which is already so intense), the lack of which has been the cause of China's many woes, and will give that middle term of a large intelligent and practical body of men of affairs between the throne and the masses, so notable in Japan and which China so sadly needs. The progress in both Japan and China has neces-

sarily been thus far mostly of the material, educational, and economic sort, for neither the Chinese nor the Japanese take kindly to the abstract thought or science of the West. It is an exceptional thing to get a Japanese or Chinese to listen patiently to the presentation of even the outlines of a metaphysical or abstract argument or proposition. Hence, therefore, in its doctrinal form, Christianity has made but slight progress, and the chief experience noted by foreigners in the reception of an Occidental creed of any historic name by Chinese or Japanese has been its simplification. It seems quite certain that Christianity as known and practised by the countries of the Extreme Orient is to a very hopeful degree expressed in practical forms or in reform. Nor is it at all likely that in accepting what Jesus taught these peoples will ever receive or assimilate also that Greek philosophy, Roman tradition and doctrinal achievement, and the ethnic peculiarities which form so large a part of popular Christianity in America and Europe.

The chief role which the Japanese are to play in the future—with probably the development of reserves of power greater than the average Occidental suspects in them—will be as the teachers of the Chinese, who number one fourth of the population of the world, by interpreting to the sons of Han the civilization and systems of the West, themselves acting as the middle term between Occident and Orient.

This article does not pretend to picture or set forth in detail the external progress which Japan and China have made in revenue or development of natural resources, or to tabulate by statistics the possession of the material forces of the West as seen in railways, steamships, lighthouses, telephones, etc., and the manifold application to the comforts and conveniences of life of western inventions. So long as the ideas bred by a rigid Confucianism or the hardening of those ancient Chinese and Japanese traditions and dogmas which once were living forces of progress, but which have long since become obstacles to growth, prevailed in these lands, there could be no real progress. All changes which seemed progressive would be mere surface efflorescence rather than organic and vital growths. With the adoption of universal principles of truth, as formulated in science and illustrated in the lives and work of good men and women, the old mists of superstition pass away, the matted growths of tradition are plowed up, and the mental soil of the Chinese and Japanese lies open to receive the seeds of new and perennial progress. Those who look beneath the surface have every reason to believe that the progress of the past fifty years in China and Japan has been as genuine, and will be as fruitful for the good of the race as that made in the western world.

WM. ELLIOT GRIFFIS,

Author of 'The Mikado's Empire' and 'America in the East.'

China Decoration. The decoration of china, and, indeed, of all kinds of clay wares, falls into two groups: (1) Controlled by method, and (2) controlled by producer. The former group deals with the fact that a decoration can be introduced at any stage of the manufacture; the latter concerns itself with the various handicrafts employed.

CHINA, GREAT WALL OF

Decorations may be used under the glaze, either on the unburned or burned clay; in the glaze, as a natural coloring; on the glaze, after the hard-glaze fire.

Decorations on the clay usually take the form of *sggraffito* (incising); inlaying, or *pâte-sur-pâte*; or painting with diluted clay. In the two latter it is important that the inlaid or overlaid clay should be similar in composition to the main body, or the fire will cause them to separate. The body piece, formed either in a mold or upon the wheel (see POTTERY), is kept quite damp, and the design, lightly sketched in India ink, is carefully followed. In inlaid work a channel is tooled out of the body, and filled in with clay of a different color. In *pâte-sur-pâte* no cutting out is necessary, but usually the background is stained a dark color and the design is laid on in white. The beautiful works of M. Solon are of this class.

On the burned ware under-glaze decoration may be either painted or printed. Most of the modern hotel and restaurant ware is printed under the glaze.

For some classes of work a coloring added to the glaze itself is very effective. By this means are produced the flowing and flashed effects much followed by the Japanese and by many French ceramists. In America the Dedham Pottery has worked in this direction.

For work over the glaze a lower fire is employed, many more colors are available, and the processes of decoration include painting, gilding, printing, and ground-laying.

Ceramic colors are made from certain metallic oxides with which are blended a fusible flux, so that the mixture may melt and attach itself to the glaze. Various fluxes are in use. They are composed of red lead, borax, and quartz sand in varying proportions. These ingredients are melted together, and the resulting glass is finely ground. For blues the oxide of cobalt is used; for greens, those of copper and chromium; for yellows, antimony and lead; for reds and browns, iron; for dark brown, manganese; and for grays, nickel and iridium. Gold produces rose color and purple, and a pink is also made from tin oxide and chromic acid. In some cases the colorant and the flux are melted together; sometimes they are united only in the grinding-mill. For under-glaze work, as well as for the coloring of clays and glazes, the list is not so full. Some of the oxides fail under the higher temperature, and must therefore be confined to over-glaze use.

In the second group, decoration is considered as a handicraft. Division of labor is the rule in a manufactory, and thus a piece of china may pass successively through the hands of the ground-layer, the painter, the printer, and the gilder, together with those of many minor operators. To the ground-layer falls the task of distributing an even tint over the whole piece or upon some part of the design. Using a stiff oil, —linseed boiled with litharge or lead acetate.— he dilutes it with turpentine, and brushes a thin coating over the china. This coating he dabs with a soft linen pad, and then spreads the color, which is a fine dry powder. A certain quantity adheres to the oil, and a smooth tint is the result. If only part of a design is to be covered, the free portions are painted with a water-color mixed with molasses. The work is oiled and dusted as before, and is then immersed in water,

when the water-color is washed up, taking with it any of the ground color which may have settled upon it.

The painting of china scarcely needs a description. The colors are as already explained, and the painting depends upon the personal skill put forth. The colors are mixed in turpentine and fat oil just as the painter pleases, for each artist mixes his own palette. The colors change somewhat in the fire, but not as much as is often supposed. The main difference is a great gain of brilliance.

The gilder is mainly employed to embellish the work of others. He uses pure gold, as pure as it can be purchased. This is received in the form known as "coffee gold," a brown granular mass. Mercury is added of about the same weight as the gold and the whole is ground perfectly fine. When mixed with the proper oil this can be used freely as a paint, and the oil and mercury are driven off in the fire. Gold thus prepared needs to be burnished after firing; but there is another form of gold, known as bright or liquid gold, which is much cheaper, and therefore largely used on common wares. In this case the gold is dissolved and the solution is mixed with certain oils. The fire removes everything but the metal, which is left as a brilliant film on the china.

Printing from copper plates has been in use ever since 1756, but for many years has taken an inferior position. At first it was employed for fine engravings and decorative subjects, but lately only for borders and outlines. The pattern is engraved upon a plate of planished copper, and the printer makes this plate quite hot upon his stove. The color, mixed in a very stiff oil, is also kept hot, and with this the engraving is charged. An impression is taken upon thin paper, and this print is handed to a woman who cuts away the superfluous paper and presses the print on to the china. A bath of cold water removes the paper, and the color, rendered hard by the low temperature, remains firmly fixed. The fire completes the process.

Lithographic printing is now very popular in china decoration. The process was introduced from France some 12 years ago, and for a long period the prints were made abroad, but recently the more successful manufacturers have established their own lithographic departments. The prints are made in the usual way from stone, except that no color is applied to the stone itself. The impression is taken in varnish, and the color is dusted on the printed paper. On account of the transfer the order of impression is reversed, the print which is first on the paper becoming uppermost when the impression is transferred to the china. The paper used is double, consisting of a sheet of tissue paper cemented on to a stiff backing. The stiffness is necessary to withstand the pressure of the machine, and when printed the tissue is stripped from the sheet and proves flexible enough to accommodate itself to the surface of the ware. The printing is done in vitrifiable colors, of course, and the finished china is fired in the usual way.

China, Great Wall of, the largest artificial structure on the face of the earth, a barrier extending for about 1,500 miles in the north of China Proper, of which it partly forms the boundary. Its western end is in the deserts of

CHINA INK—CHINCHILLA

central Asia, its eastern reaches the sea to the northeast of Peking. It was erected as a barrier against the inroads of the barbarous tribes, and dates from about 214 B.C. It is carried over height and hollow, and avoids no inequality of the ground, reaching in one place the height of over 5,000 feet above the level of the sea. Earth, gravel, brick, and stone were used in its construction, and in some places it is much more substantial than in others. Its greatest height, including the parapet on its top, is about 50 feet, and it is strengthened by towers at regular distances.

China Ink, or **Indian Ink**, a black solid substance, which, when rubbed down with water, forms a very pure black indelible ink. It has been used in China from time immemorial, and both there and in Japan is employed for writing, small brushes being the implements made use of. In Europe it is used by draftsmen, artists, etc. It is manufactured in various ways and from various materials, but consists essentially of fine lampblack incorporated with a gluey substance, the whole being dried and consolidated into cakes and sticks. Some kinds are made with animal or ivory black, others with lampblack got from camphor or oil of sesame. There is generally added some perfume—a little musk or camphor. Many attempts have been made to imitate Chinese ink, some of which have been tolerably successful. Almost all the imitations consist of carbon ground up with gum, gelatine, or fish-glue, but the quality and tint may vary according to the special carbon employed and the process of manufacture. Good Chinese ink should have a velvety black appearance, with a gloss which becomes very conspicuous on rubbing. The color it gives on paper should be pure black and homogeneous, and if water be passed over it it should not run or become streaky. See **INK**.

China Root, the root or rhizome of *Smilax china*, a climbing shrubby plant closely allied to *sarsaparilla*, for which it is sometimes used. *Vitis sicyoides*, a species of vine, is known by this name in Jamaica.

China Rose, the name given to a number of varieties of garden rose chiefly derived from *Rosa indica* and *R. semperflorens*, both natives of China. The name is also given to *Hibiscus rosa-sinensis*, one of the mallow tribe, common in China and the East Indies, and an ornament in greenhouses.

China Sea, that part of the North Pacific Ocean bounded on the north by Formosa, on the northwest by China, on the west by Anam and the Malay Peninsula, on the southeast by Borneo, and on the east by the Philippines. It contains numerous islands, receives several considerable rivers, and forms the important gulfs of Siam and Tongking. The currents in this sea are very mutable, depending much upon local circumstances.

China-tree, **Wild**, a common name for the soapberry-tree (*Sapindus marginatus*). It is a handsome tree, sometimes growing as high as 60 feet. The flowers are white and the oval berries are very saponaceous. It grows from Florida westward to Arizona and northern Mexico, and in southern Kansas. The wood is very hard, and heavy, weighing nearly 60 pounds to the cubic foot.

China-ware, the name given to porcelain made in the Chinese empire and imported as "China ware," now chiefly confined to the soft porcelain made in England, of which bone-ash is the characteristic ingredient. This class of ware is called "bone china" by the potters and dealers of America.

Bone-ash was used at Bow and at Chelsea, near London, as early as 1750 and has been extensively employed ever since. Bone china consists of kaolin, pigmatite, or Cornwall stone, and bone-ash. The clay and rock are found in Cornwall, England; the bone is largely imported from America.

The proportions in a dry mix are about as follows: Kaolin, 40; stone, 20; bone-ash, 40. The heat at which the kilns are burned ranges from 2,300° to 2,400° F. Bone china is not made to any great extent in America, though some few manufacturers have put it forth as a side line. The particular merits of this ware lie in its snowy whiteness, and in the soft glaze which makes it possible to produce very beautiful decorations over the glaze. For rich services this class of china is unrivaled. See **PORCELAIN**.

China Wax. See **WAX**.

Chinandega, chē-nan-dā'ga, Nicaragua, a town 26 miles northwest of Leon, and 10 miles from the port of Corinto on the Pacific, with which and with Managua it is connected by rail. It is a place of considerable trade. Pop. about 11,000.

Chinch, the popular name of certain fetid American insects of the family *Lygaeidae*, genus *Rhyparochromus*, resembling the bed-bug, very destructive to wheat, maize, etc., in the southern and western States. The name is also applied to the common bed-bug (*Cimex lectularius*).

Chincha (Chēn'cha) **Islands**, a group of small islands off the coast of Peru; lat. 13° 38' S; lon 76° 28' W. They are granitic, arid, and destitute of vegetation, and the coasts bold and difficult of access. Immense deposits of guano used to exist here, but after being exported for 34 years the supply became exhausted in 1874.

Chinchaycocha, chēn-chī-kō'chā, a lake of Peru, in the department of Junin, 13,330 feet above the level of the sea; 36 miles long and 7 broad, with an area of about 300 square miles. It is the source of the river Jauga, and abounds in fish and wild fowl.

Chinchilla, chīn-chēl'yā, Spain, a city in Murcia, in the province of Albacete, 10 miles southeast of the city of that name; situated on a rocky eminence. It is surrounded by a wall and commanded by a castle. Its handsome parish church has three naves, and a lofty tower containing six bells; the interior is richly decorated and contains pictures and other works of art. Quarries of granite, alabaster, gypsum, and limestone are wrought in the vicinity. Pop. 6,500.

Chinchilla, chīn-chīl'la, a genus of South American herbivorous rodents allied to the cavies, which they resemble in the general shape of the body, in the limbs being longer behind than before, in the conformation of the rootless molars, and by the nature of the fur, which is more woolly than silky. *C. lanigera*, the only species, is about 15 inches long from the muzzle to the tip of the tail, and is covered with a beautiful pearly-gray fur, which is highly

CHINCHOLLE — CHINESE ARCHITECTURE AND ART

esteemed as stuff for muffs, pelisses, linings, etc. The chinchilla lives gregariously in the mountains of western South America, and makes numerous and very deep burrows. It is gentle and sportive, loses none of its gaiety in captivity, and is very cleanly. This genus gives its name to the family *Chinchillidae*, which contains two other genera, one (*Lagidium*), including a large chinchilla-like rodent of the Andes; and the other (*Lagostomus*), containing that large numerous burrower of the pampas called vizcacha (q.v.).

Chincholle, shǎn shǒl, **Charles Henri Hipolyte**, ip-pō-lêt, French novelist: b. Chauny, France, 16 July 1845; d. Paris 21 Aug. 1902. In the earlier portion of his career he was secretary to the elder Dumas, with whom he occasionally collaborated, and from 1872 was a member of the staff of 'Figaro.' He was an extremely versatile writer, but his style is wanting in finish. Beside his one-act farce, 'Oncle Margotin,' which ran 300 nights in 1870, and 'Le Mari de Jeanne' and other plays, his romances and other works include 'La Plume au Vent' (1865); 'Alexandre Dumas Aujourd'hui' (1867); 'Les Pensées de tout le Monde' (1868); 'Dans l'Ombre' (1871); 'Le Lendemain de l'Amour' (1880); 'Le Catalogue de l'Amour' (1881); 'Paula, Histoire d'une Neurosée' (1882); 'La Ceinture de las Survivants de la Commune' (1884); 'Le Vieux Général' (1886); 'Femmes et Pois' (1886); 'La Grande Prêtress' (1887); 'Biographe du Général Boulanger' (1889).

Chinchon, chèn-chôn', Spain, a town 25 miles southeast of Madrid. After a Countess of Chinchon, wife of the governor of Peru in 1638.

Peruvian bark was named "chinchona," now habitually misspelled "cinchona."

Chinde, Africa, a town on the only navigable mouth of the Zambezi. Here the inland steamers meet the ocean steamers of various European companies; and here, too, Great Britain has obtained from Portugal a small piece of land called the "British Concession" for commercial purposes, and a residential district called the "Extra Concession."

Chinese Arrowroot. See NELUMBium.

Chinese Architecture and Art. The fine arts in China are as varied in character and as rich and tasteful in design as those of the peoples most successful in art; but they are known to Europeans in a very unequal fashion. Thus the architecture of the vast country, contained in the old provinces of China, as large as the United States west of the 100th parallel, and as diversified in soil and climate, is so little known that the essays on the art written even by former residents in China deal obviously with certain very limited places only—the neighborhood of a certain city, the borders of a certain river, and the like—and are, moreover, the studies of men not conversant with the construction or with the decorative buildings of any part of the world. The history of this architecture is yet to be written. The photographs now obtainable, having been made during the years since 1890, open up a new world of architectural art. It is enough to say here that there exist two systems of building: the one being a framed construction, usually of wood and capable of

great elaboration, the other a solid masonry construction carried out in brick or stone according to the resources of the neighborhood and the cost of the building. The framed system of building is closely akin to that used in Japan; and it is there that we can best study the wooden temple-tower and the wood-framed hall of reception. As for the masonry buildings, they are often large and massive, as is well known to all who have observed the walls and gateways of the great fortified cities and the famous "Great Wall" which protected Peking and its neighborhood from northern invasion. In the way of more decorative buildings less is known of the system of design, but several peculiarities may be mentioned. Thus there is a marked preference for the octagonal form in towers, and everywhere throughout the central provinces these buildings, called by the Europeans pagodas, rise above the hills and show over the groups of houses. The often cited use of the polygonal arch, that is, one with the intrados at least many-sided instead of curved, is to be noted as indicating how much that is attractive we have still to discover. The decorative gateways (pailoo) corresponding nearly to the *torii* of Japan and to those edifices called *toran* in the peninsula of India, are often admirable designs in the way of purely decorative architecture, monumental architecture, having no direct utility. The dwellings of the Chinese, even the palaces of the princes, do not seem to include many-storied and ponderous structures, but cover immense tracts of ground with gardens, among which stand buildings of no great height, but of a singular beauty of construction, especially in the roofs, and very richly decorated within. The dwelling-houses of the people are generally walled with brick and are not striking in their external appearance. The roof is an especial feature in Chinese art. It is commonly built with a hollow upward curve, the result of a very interesting system of construction, with light wood-work. This slightly concave surface covered with glazed ridge-and-furrow tiles richly colored, is an important feature in Chinese architectural composition. Painting in strong pure colors is a recognized element of external design; and it has been truly said that the special and distinguishing feature of Chinese exteriors is gaiety. Even the slightly-built one-story shops of the great towns are bright with vermillion and green; and the signs, painted with the very ornamental Chinese ideographs, help in this effect.

Chinese painting reached a great development as early as the 8th century A.D.; and there is every probability that it had then been a great school for several centuries. Landscape was one of its especially favored branches. While in Europe no one dreamed of landscape art for its own sake, the Chinese impressionist designers were producing admirable studies, both in color and in monochrome. Some few of these are in European museums, their authors and dates having been fixed by careful comparison, but the much more modern Japanese landscapes, in painting, monochrome, and wood-cut, are the best material from which to gain a general idea of that ancient landscape art. A highly religious art was developed in the 12th century A.D. At that time Buddhist religious feeling was strongly expressed in the art of some painters, while others affected rather a kind of decorative realism, that

CHINESE ART.

1. Enameled plate on copper. 2. Porcelain vase (Siwen te, 1426-1436). 3. Painted Screen. 4. Porcelain Vase (Ming, 1368-1644). 5. Snuff-flask, in green glass. 6. The War-God, Kwan-ti, in porcelain. 7. Tea-pot, from Thon. 8. Embroidered altar cloth. 9. Silk embroidery. 10. Comb for the hair.

is to say, a close observation of natural objects used to inspire and to influence a highly decorative system of design. These paintings have been little known to Europe, because they are preserved in temples and almost inaccessible palaces; and again it is Japan which has opened to us, through her own art, a knowledge of the older arts of China. A few ancient paintings known to Europeans are of surprising interest; and they open up to us a whole system of design in form and color on the flat surface, which the West is now studying, much to its own advantage. The paintings best known to us are of some purely decorative character, those on porcelain having attracted the attention of Europe ever since the 16th century. These paintings are closely connected with the system of inlay which in the form of cloisonné enamel (see ENAMEL) is another of the great art industries of China. The porcelains affect a more close and careful study of the natural forms in flowers, trees, costume of figures and the like, whereas the enamels are more severe and are confined more closely to the making of admirable patterns; but the two systems differ only as one and the same artist might change his style according to the material and the demands upon him. A similar method of decoration by the free use of natural forms, conventionalized but still retaining much of their character, is seen in the splendid embroideries which have been little known to the West until within a few years. The textile fabrics of China — silks, brocades and velvets — have been known to collectors for many years, but very few national museums have provided themselves with any number of them: they present an inexhaustible treasure of beautiful design in strong and positive colors. It may be stated here that brilliant color is a specialty of the Chinese artist. Where, as in a fine cloisonné enamel, a Japanese artist works in dark and sombre colors, the Chinese will use a sky-blue ground, upon which an elaborate pattern is carried out in deep ultra-marine blue, violet, reddish-gray, dark green, apple green, vermillion, bright yellow, and white, with dividing lines of gilded metal, and many passages of gradation from one color to another. No people have equaled the Chinese in the decorative use of bright, pure colors.

Sculpture in the sense of a grand and permanent art of form is less the business of the Asiatic artist than painting, or than decoration properly so-called. Sculpture in the form of carving in ivory and wood and bronze figures of small size, has always attracted great attention in China and has reached an extraordinary state of excellence in spirit, movement, and skilful composition. Thus, a bronze figure will express perfectly the character and the sentiment of the occasion, while yet losing nothing of its sculptural value; and a group of "The Seven Wise Men" seated around the trunk of a bamboo will be rendered in cheap glazed pottery or in minutely carved ivory with equal skill and at a price proportionate to the labor expended and the prime cost of the material.

The ivory group may have cost, when new, a hundred times as much as the piece molded in clay, fired and then glazed and painted, but it is not on that account a finer design, the characters are not more perfectly expressed nor the attitudes of the figures more forcible or

more harmonious with each other. This is a great evidence of an old traditional skill of sculpture excelling in the larger as well as in the smaller scale of work. Relief sculptures, especially those in wood, in soft stone and in the face of lacquer, which has generally a wooden background prepared to receive the impressed and sculptured coat of the viscous material, are as effective for their decorative purpose as are the sculptures in the round. Finally there must be mentioned the lapidary's art, in which the Chinese have always excelled, for the most marvellous carvings in agate, jade and rock crystal, that is to say, in the hardest materials known, are unmatched in the world, and they are as artistically perfect as the carvings in the softer stones; their essential characteristics perfectly understood and always observed. The conventional way of rendering in hard material the most delicate leafage and sprays of twig and blossom is perfectly maintained; and the brilliant polish which is one of the beauties of these carvings is carried through beneath those delicate undercut sprays.

RUSSELL STURGIS,

Author of 'Dictionary of Architecture.'

Chinese Bible, The, a work compiled and partly composed by Confucius, divided into five books:

1. Called the 'Yih-King,' a treatise on cosmogony.
2. Called the 'Shu-King,' the acts and maxims of Yaou, Shun, and other ancient kings held in religious veneration.
3. Called the 'Shi-King,' which contains 311 sacred poems.
4. Called the 'Fe-King,' or book of rites, containing maxims and directions for everyday life and all conditions of men.
5. Called the 'Chun-t sien,' a history of Confucius' own times.

Chinese Cæsar, The, Kao-hoangti, founder of the Han dynasty, one of the most illustrious that ever occupied the Chinese throne. Dynasty lasted 202 B.C.—226 A.D.

Chinese Immigration. Until the California gold discoveries of 1848 there were literally no Chinese laborers in the United States; nor was there then, or for years afterward, the least prejudice against their coming — the one objection to the Chinese being that they kept foreigners out of their own country, not that they infested others. From 1840 to 1850, according

CHINESE IMMIGRATION

to the records of immigration, only 35 came over, and those all in the year from June 1849 to June 1850. The treaties of 1844 and 1858 with China expressly aimed at securing a freer interchange both of commodities and citizens. The current "buncombe," even in California (the surest indication of public feeling, because its one aim is to please the unreflecting) was to proclaim America the asylum for the poor and oppressed without exception; and San Francisco business men welcomed the early Chinese comers, publicly fraternized with their traders, and made speeches of mutual compliment, with no objection from any source. During the next decade 1850-60, 41,397 Chinese came to the port of San Francisco, of whom about 6,500 returned to China, leaving the net Chinese population in 1860 34,933, nearly all in California. For some years the general feeling continued to be favorable, as labor was dear and domestic service almost impossible to obtain; and the Chinese laborer, and above all, the Chinese house servant, seemed to make industrial progress and lives of refined leisure possible. In the latter half of the decade some uneasiness began to be felt, but mainly from the belief that Chinese criminals were being deported here. The first restrictive legislation, not specifying Chinese, was to prohibit this. In 1855 an act was passed, said to have been aimed against the Chinese, fining any shipmaster \$50 who landed passengers incapable of becoming citizens of California under its Constitution and laws, and ordering commissioners of immigration to obtain certificates of identity; but this, too, must have referred to criminals alone, for there was at this time no bar to Chinese citizenship. In 1858 the Reed Treaty was negotiated, after the Chinese war of that year, and no restriction was placed on immigration. In 1862 the California legislature appointed an investigating committee on the subject; but it was still felt to be only a local nuisance, not calling for any hasty or severe measures. Even as late as 1868 the Burlingame Treaty with China, though reprobating enforced immigration (coolies under contract), asserted the right of migration to be inherent in the human race; and on 27 July 1868, a special resolution of Congress, in response to anti-immigration measures in the East, repeated this assertion as to the right of human beings to expatriate themselves, and declared that its restriction was contrary to the fundamental principles of the republic. This meant European immigration, and caused a painful "straddle" in later political campaigns when California votes were needed; but it proves that even then the Chinese question had not become acute enough locally to force California politicians into making it a national touchstone. Within a few years after this, however, it was not only the burning issue of the Pacific Slope, but had emerged into the national arena. Bret Harte's 'Heathen Chinese' shows that "Chinese cheap labor" had become a popular local catchword; and the attempt of Eastern manufacturers about this time to use the Chinese for strike-breakers made the question of national notoriety.

This hostility was partly due to the Chinese as such—as extreme aliens with social and religious customs marking a permanent separation; but mainly to the special character of the immigration. Except a few merchants, it consisted almost wholly of the lowest class of coolies

about Canton, and it was firmly believed that it was not voluntary and self-selected immigration, like that from Europe, but a system of exploited serfage—the coolies being collected in gangs by a Chinese corporation called the Six Companies, and shipped under rigid contract to work for a period of years under terms fixed by their masters. Their low standard of comfort was believed to affect the market and wage-rate for white labor unfavorably, and to build up great corporations without building up a corresponding class of civilized citizens; their sections of the cities were plague-spots of overcrowding and filth, besides being Alsatias where law did not run; they brought no wives, intending no permanent residence, and supplied the places of wives with hundreds of imported Chinese prostitutes; and their iron-barred opium joints, tempting not Chinese alone, were a still greater danger. Lastly, those who saw the excessive strain placed on democratic institutions by ignorant European immigrants, ultimately assimilable, were appalled at the prospect of operating them among a huge unassimilable and purchasable brute-vote on the Pacific Slope. If they were made voters, they would force a permanent political division on the lines of race; and if not, would form a dangerous anomaly and nuisance in the republic. Thus, white industry, order, sanitation, public morals, and statesman-like forecast united in the conviction that this class of immigration must be prohibited or severely restrained. These valid objections and fears were reinforced by others, unsound or exaggerated. The numbers arriving were vastly swollen in popular imagination, and the departures suppressed; except that when a point was made of their worthlessness to the country, it was asserted that all returned to China and so "drained the country" of their wages—which, if true, of course nullified the permanent danger from them, and involved an economic fallacy. The actual number of Chinese in the United States in 1870 was 62,376, an increase of some 27,000 in 10 years; 69,298 had come over within 10 years, and 34,850, or over one half, had gone back. But it was generally stated at 150,000 to 175,000; and the rate of increase at fully 25,000 a year. The population of China was estimated at 400,000,000 (pure guesswork), and it was assumed that the immigration represented a tendency diffused through this entire mass, who could and probably would pour 100,000,000 of its people into America in a short time, and swamp the European element utterly. As a matter of fact, the entire immigration came from within 40 miles of Canton, and the mass of Chinese will not emigrate, even to countries where they have full civil rights. It may be mentioned that in such places as Java and Hong Kong, they live and die with the same permanency as others; so that the argument which rests at once on the danger of their remaining and the financial loss of their not remaining must lose the latter clause. It was also asserted that there were more Chinese males in California than voters; but in fact they were under one sixth. But after all deductions, it was certain that the Chinese population in no long time would form a grave and apparently insoluble problem, a social and political menace, on the Pacific coast, and that the State could better afford a slower industrial growth, than a rapid

CHINESE LANGUAGE—CHINESE SWALLOWS' NESTS

one based on a proletariat and a body almost equally dangerous as citizen or aliens.

After attempts at restriction by local legislation, which were invalidated by the federal courts as in violation of United States treaties, California appealed to Congress for a national law; but that body evaded the question till 1876. Then the exigencies of the Hayes-Tilden campaign compelled both parties to bid for California's electoral vote by anti-Chinese planks in their platforms; and Congress (the House, 6 July, the Senate 17 July), appointed a joint special committee to investigate the subject. It met at San Francisco 18 October, heard a mass of testimony, and made a very voluminous report, taking the strongest ground in favor of a restrictive law (Senate report 689, 44th Congress, second session, 27 Feb. 1877). At this time the Chinese population was about 100,000. Nevertheless, the party pledges were not redeemed in Congress till 1879, when on 20 March such a bill was passed; but it was vetoed by President Hayes as being in conflict with the Burlingame Treaty. In 1880 a commission was sent to Peking to negotiate a new treaty permitting the restriction. This treaty, signed 17 Nov. 1880, ratified by the Senate in March 1881, gave the United States the power to "regulate, limit, or suspend" the immigration of new Chinese laborers, but not to prohibit it altogether; permitted laborers already in the country to remain and travel to and from it at will; and allowed Chinese merchants, students, teachers, or travelers, to exercise their functions without molestation, each class to have all the privileges and advantages of the most favored nation. (The Chinese population here in 1880 was 105,465.) Under guise of giving effect to this treaty, Congress, in March 1882, passed an act suspending Chinese immigration altogether for 20 years. This was vetoed by President Arthur on the ground that so long a suspension was virtually absolute prohibition, and not in accord with the spirit of the treaty. On 6 May another bill was passed to meet this objection, suspending fresh immigration for 10 years, both of skilled and unskilled laborers, permitting those already here to remain, but forbidding their naturalization. The provisions of this act were minutely severe. The exempted Chinese must have certificates of identity issued by the Chinese government and vised by the United States consul or diplomatic representative at the port of departure; departing Chinese laborers must take out return certificates, with heavy penalties for forgery or false personation; a master of a vessel who landed any unauthorized Chinese was subject to fine and imprisonment and the confiscation of his vessel; no Chinese passengers could be landed until the collector of the port had received the lists of the passengers and compared them with the persons, etc. The only Chinese laborers who could be permitted to return after once departing were those who had a living wife, parent, or child here, or \$1,000 worth of property, which was made answerable for their default.

This was "amended" on 1 Oct. 1888 by the Scott Act, striking out all permission to return for any purpose, forbidding the issue of return certificates, and declaring all that were issued void,—in a word, absolutely barring America to any Chinese workman once outside it. A treaty

was at this time pending between the United States and China by which the Chinese government was to prohibit the emigration of laborers, and the United States was to protect those in the country from violence, which it had shamefully failed to, but the Scott Act enraged the former government, and it refused to ratify the treaty. It may be mentioned that the supreme court in 1883, October term, decided that Congress can abrogate a treaty. On the expiration of the 1882 act in 1892, the "Geary law" of 5 May, extended it for another 10 years, with further severities, not called for by any dangers at hand; chief of these, that any Chinaman found in this country unlawfully should be imprisoned for a year at hard labor. On 3 Nov. 1893, on complaint that Chinese are so much alike to Western eyes that certificates of identification are not sufficient, an act was passed that each certificate must include the holder's photograph in duplicate. On 7 Dec. 1894, a convention with China restored the conditions of return to the status of 1882. On 3 March 1901, it was enacted that a Chinaman can only be arrested under these acts on sworn complaint of certain specified United States officers. In 1902 the exclusion was re-enacted for another decade. With the general intent of these acts, there is little difficulty in concurring; but some of the provisions, and the petty acridity of their execution, exhibit a spirit of panic which is neither dignified nor sensible. The volume of the immigration is the very essence of the danger; if it is insignificant it is harmless. Hence, the groundless harrying of innocent travelers or students, as if the mere presence of a single Chinaman constituted a grave national danger, is unmanly and irrational. The Chinese population in 1890 was 107,488; in 1900, 89,863—a falling off of nearly 20,000 in 10 years. Consult: George F. Seward, 'Chinese Immigration' (1881); Mayo Smith, 'Emigration and Immigration' (1895); and the congressional report above cited.

Chinese Language, Literature and Writing. See CHINA.

Chinese Lantern, a lantern made of thin paper, usually variously colored and much used in illuminations.

Chinese Olive, the fruit of *Canarium commune*, order *Amyridaceæ*, a tree of the Asiatic archipelago yielding an oil which is used as a condiment and for lamps.

Chinese Pavilion, a semi-musical instrument composed of a pole with several transverse brass plates of some crescent or fantastic form, generally terminating at top with a conical pavilion or hat. On all these parts are hung small bells, which the performer causes to jingle by shaking the instrument held vertically up and down. It is employed only in military bands, and is more for show than use.

Chinese Swallows' Nests, curious productions, which sell at a high price in China, though they have no special points of recommendation beyond many other gelatinous ingredients in soups. They were formerly supposed to be made of some species of the rose-spored *Alga*, as *Spharococcus lichenoides*; but this is now ascertained to be a mistake, and it is known that they are formed of dried saliva from the mouth of the bird itself. The nests are the production of certain

CHINESE TARTARY — CHINOOK WIND

species of swifts (not swallows) of the genus *Callocalia* which breed in caves on islands of the tropical Pacific and Indian oceans. All species of swifts secrete an abundant mucous saliva which is utilized along with other materials in constructing the nests; but species of *Callocalia* only form their nests of saliva exclusively.

Chinese Tartary, an old name of Eastern or Chinese Turkestan.

Chinese Terms. See CHINA.

Chinese White, a pigment prepared from the white oxide of zinc (ZnO), introduced into the arts in the latter part of the 18th century as a substitute for the preparations of white lead. Its color is not changed by exposure to the air.

Chinese Windlass, a differential windlass, in which the cord winds off one part of the barrel and on to the other, the amount of absolute lift being governed by the difference in the diameters of the respective portions. It is a good contrivance in the respect that great power may be attained without making the axle so small as to be too weak for its work.

Ching, Chinese prince: b. Peking about 1840. He is related to the Chinese imperial family and has held important civil and military posts, although he boasts that he has never been outside of Peking. He was at the head of the Tsung-li-Yamen, but was deposed in 1900 for his efforts to protect the legations in Peking, during which he attacked the Boxers (q.v.).

Ching-Hai, ching'-hī', or **Chin-Hai**, China, a seaport in the province of Che-Kiang, about 11 miles from Ningpo. Ching-Hai has no foreign commerce of its own, not being a treaty port; but is a resort for native traders from the Chusan Archipelago, and from here Chinese merchandise is sent to Ningpo. There is a missionary station and a native academy for students who compete in the civil service examinations at Ningpo. Pop. (1900) estimated 150,000, mostly Chinese.

Ching-Tu, ching-too', China, city, capital of the province of Sze-Chuen, situated on the Min River, 150 miles from its junction with the Yang-tse-Kiang, and 175 miles from the treaty port Chung-King. Ching-Tu is in one of the largest fertile plains of China, and is surrounded by mountains rich in the minerals of commerce. By way of the Min River and canals nearby, trade is carried on with the places in the valley of the Yang-tse-Kiang. The walls around the city are 12 miles in extent. The houses and streets indicate wealth. Telegraphic communications have been established with Hankow. It has an arsenal with modern equipment, and goods of European manufacture are found in some shops. Pop. about 9,000,000.

Chingleput, ching-glē-pūt', or **Chengalpat**, or **The Jaghire**, India, a coast district in the province of Madras, area 2,842 square miles, surface rocky, water scarce, crops scanty. In the fertile localities grain and fruits are raised which are shipped to the Madras markets. Some manufacturing of cloth is carried on. The chief towns are Conjeeveram, St. Thomas'

Mount, Saidapet, Tiruvotiyur, and Chingleput. This tract of country was obtained in 1760 and 1763, by the East India Company, from the Nabob of Arcot. It was invaded by Hyder Ali in 1768, and again in 1780, when it was nearly depopulated by famine and emigration. Pop. 1,136,928.

Chingleput, or **Chingalpat**, India, town in the district of the same name, 15 miles west from the Bay of Bengal, 35 miles southwest of Madras, situated in a valley surrounded by hills. In 1751 it was taken by the French, retaken the following year by the British under Clive. A railroad enters the town. It has Roman Catholic and Protestant missions, hospital, jail, civil and criminal courts, and a dilapidated fortress which at one time was of considerable extent and well fortified. Pop. 7,000.

Chin'iot, India, town in the Jhang district of the Punjab, near the Chenab. It is famed for wood-carving, and has manufactures of coarse cloth. Its trade is also of considerable importance. Pop. 13,476.

Chiniquy, shē-nē-kē, **Charles Paschal** **Telephore**, Canadian clergyman: b. Kamouraska, Que., 30 July 1809; d. Montreal 16 Jan. 1899. He was a Roman Catholic priest from 1833 to 1858, when he abandoned the Roman Catholic and joined the Canadian Presbyterian Church. He lectured in England in 1860, 1874, and 1882, and in Australia 1878-80. He wrote 'The Priest, the Woman, and the Confessional' (1874), a work that has had an enormous circulation in English-speaking countries, and has been translated into French, Italian, Spanish, and Dutch; 'Fifty Years in the Church of Rome' (1886; 5th ed. 1886); Papal Idolatry: Exposure of the Doctrine of Transubstantiation' (1887).

Chinkara, the common gazelle of India, sometimes called the "ravine deer." See GAZELLE.

Chinoline, kīn'ō līn. See QUINOLINE.

Chinon, shē-nōn', France, an antique town in the department of Indre-et-Loire, beautifully situated on the Vienne, 31 miles southwest of Tours. Crowning a lofty rock are the ruins of its vast old castle, the French Windsor of the Plantagenets, the death-place of Henry II., and later the residence of several French sovereigns, where, in 1429, Joan of Arc revealed her mission to the Dauphin. A farmhouse across the Vienne is pointed out as Rabelais' birthplace. Pop. (1901) 4,200.

Chinook (chī-nūk') **Wind**, a warm dry wind that often blows from the Rocky Mountains over the plains that stretch from their eastern base. The moisture-laden winds from the Pacific Ocean striking the lofty barriers of the Cascade and Rocky Mountains are forced to precipitate their moisture as rain and snow. When the ranges are crossed the winds are cold and dry. Descending the eastern slopes of the mountains the winds become warmer, because in descending the air is condensed, the atmospheric pressure at the base of the mountains being much greater than at the summit. The winds are, however, still dry, all their moisture having been precipitated in crossing the mountains. In the de-

Photograph by J. Horace McFarland Co.

CHINQUAPIN

CHINOOKS—CHIOS

scent of 10,000 feet or so to the plains of Montana and the prairie province of Canada, the winds become so warmed by the increased pressure that they give a mild climate to regions far north. It is on account of these winds that cattle on the prairies of Alberta can graze in the fields all winter, a snowfall of a foot or more disappearing in a few hours before the warm, dry breath of the Chinook. Not all the warm winds of Montana and the regions north and south have their origin west of the Rockies. Various causes contribute to the formation of descending air, and when the descent is a number of thousands of feet, the winds resulting are always warm. Such winds blow over prairie regions west of the Missouri, but not always adjacent to the Rockies. Similar warm winds are known in other parts of the world, as in Switzerland, where they are called Föhn winds.

Chinooks, *chí-núks'*, a tribe of Indians, now nearly extinct, on the Columbia River, or in Oregon. Their language is very difficult to learn and to pronounce, and this led to the formation of the Chinook jargon, a trader's *lingua Franca*, consisting of words from French, English, and Hawaiian, as well as from Chinook and other Indian tongues.

Chinquapin, *ching'ka-pín*, a dwarf chestnut (*Castanea pumila*), a native of South America, but growing wild in the Southern States as far north as Pennsylvania and westward as far as Texas. It is a shrub four or five feet high, but sometimes grows to the height of 30 or 40 feet.

Chins, a savage tribe living in the mountainous region between Lower Bengal and Upper Burma, of very primitive habits.

Chinsura, *chín-soorä*, British India, a town beautifully situated on the Hugli, and now included in the town of Ilugli, 20 miles north of Calcutta. It is a military station, was formerly a Dutch settlement, and contains many neat houses in the Dutch style. It is celebrated for the manufacture of cheroots, and has several schools, among them some belonging to the Free Church of Scotland.

Chintreul, **Antoine**, *än twän shän-trél*, French landscape painter: b. Pont-de-Vaux, France, 15 May 1816; d. Septeuil 13 Aug. 1873. He was a pupil of Corot, obtained a medal at the Paris Exhibition, 1867, and that of the Legion of Honor in 1870. His sunlight effects have been greatly admired. The Luxembourg Gallery contains his 'Thicket With Deer' (1873).

Chintz, a cotton cloth gaily printed with designs of flowers, etc., in five or six different colors. It was a favorite in the time of Queen Anne, long before cotton prints became cheap. The name, being highly respectable, has since been applied to goods lacking the graceful and artistic character of the genuine article. The Chintzes of the Coromandel coast were celebrated in the time of Marco Polo, 13th century. They are mentioned also by Odoardo Barbosa, a Portuguese, who visited India soon after the passage of the Cape of Good Hope by Vasco de Gama: "Great quantities of cotton cloths admirably painted, also some white and some striped, are held in the highest estimation."

Chio, *ké'ö*. See **CHIOS**.

Chiob'be, a town in China, province Fokien, 15 miles southwest of Amoy. It is situated on a river bearing different names, navigable by junks of 400 tons, and is defended by a citadel and numerous other fortifications. It is the great emporium for common china-ware, and has important fisheries. The rearing of silk-worms forms an important occupation. Pop. estimated, 300,000.

Chiococca, *kí-ö-kök'a*, a genus of tropical plants of the natural order *Rubiaceæ*, consisting of small, often climbing, shrubs, with opposite stipulate leaves and bell-shaped or funnel-shaped, yellowish flowers in axillary clusters. The fruit is a white berry with two seeds. The bark of the root of *C. anguifuga* is a violent emetic and purgative. The root of *C. densifolia*, a woody bush, is considered a remedy for snake bites by the people of Brazil.

Chioggia, *kē-öd'-jä*, or **Chiozza**, an important seaport town of northern Italy, 15 miles southwest of Venice, on an island at the southern end of the Venetian Lagoon, connected with the mainland by a stone bridge of 43 arches. It is founded on piles, has a beautiful cathedral; its harbor, the deepest in the lagoon, is guarded by forts and batteries. It is one of the strongest places in the Venetian lagoons. Many of the people are engaged in the coasting trade, lace-making, weaving, ship-building, and fishing. Pop. 25,100.

Chione, *kí-ö'nē*, the daughter of Dædalion, who was killed by Diana for boasting of her beauty.

Chios, *kí'ös* (now called by the natives *Chio*, Italianized into *Scio*), one of the most beautiful and fertile islands in the Ægean Sea, belonging to Turkey, seven miles off the coast of Asia Minor, at the entrance to the Gulf of Smyrna; about 30 miles long from north to south, by 8 to 15 miles broad, with a coastline of about 110 miles, an area of 320 square miles, and a population of about 70,000, almost all Greeks. The northern part is more mountainous than the southern part. The climate is delightful. Earthquakes are common, and one in 1881 caused the death of 3,558 persons, and the destruction of property to the value of over \$15,000,000. The wine produced on the northwest coast, the *Vinum Arvisium* of ancient times, is still esteemed. Other products are figs, also noted in classical days; mastic, silk, lemons, oranges, and olives. Goats' skins are also exported. The capital, Chios, about the middle of the east coast, contains about 13,000 inhabitants, and has a harbor touched by various services of steamers, and doing a good trade. On the west coast is a rich monastery, Nea-Moni, founded in the 11th century. In ancient times excellent marble and potter's clay were quarried in the mountains, and recently pits of antimony and ochre have been worked.

Chios is one of the places which contended for the honor of giving birth to Homer. It formed in early times one of the most flourishing of the Ionian states, and contributed 100 ships to the Greek force defeated by the Persians in the sea-fight off Miletus (494 B.C.).

CHIPMAN — CHIPPAWA

After the Persian victory the town and temples of Chios were burnt and many of the people enslaved. In more recent times the island was taken by the Genoese (1346), and by the Turks (1566), in whose hands it has since remained, except for a short interval. It was conferred as a private property on the sultana. After a long period of prosperity, Chios suffered a terrible blow during the war of Greek independence. A number of the Chiotas having in 1821 joined the revolted Samians, a Turkish fleet and army, in 1822, inflicted dreadful vengeance; 25,000 Chiotas fell by the sword, 47,000 were sold into slavery, and only some 5,000 escaped. A second rising in 1827 was likewise unsuccessful. The island has since been prospering.

Chip'man, Nathaniel, American jurist: b. Salisbury, Conn., 15 Nov. 1752; d. Middlebury, Vt., 15 Feb. 1843. He was an officer in the American army for a part of the Revolutionary War, and was admitted to the bar in 1779. He then removed to Timmouth, Vt., where he commenced practice, and served as State's attorney for four years. In 1786 he was elected assistant judge of the supreme court, being the first lawyer who had been placed upon the bench in Vermont. In 1789 he was elected chief justice, and held that office until October 1791. In 1789 he was also appointed one of the commissioners to adjust the differences between Vermont and New York. In 1791 he was a member of the convention called to decide the question whether Vermont should accede to the Union. On 18 Jan. 1791 he was appointed a joint commissioner with Lewis R. Morris to attend Congress and negotiate for the admission of Vermont into the Union. In 1793 he published a small work entitled 'Sketches of the Principles of Government,' and a volume of 'Reports and Dissertations.' In 1796 he was again elected chief justice of the supreme court. In 1796 he was appointed one of a committee to revise a code of statute laws for Vermont, and the revised laws of 1797 were written by him. He was a United States senator in 1798-1803. In 1813 he was again elected chief justice of the supreme court, and continued in office two years. From 1816 to 1843 he was professor of law in Middlebury College. In 1833 he published 'Principles of Government: a Treatise on Free Institutions, Including the Constitution of the United States,' containing portions of his former treatise.

Chip'man, Ward, Canadian jurist: b. St. John, New Brunswick, 10 July 1787; d. there 26 Dec. 1851. He was the son of Ward Chipman (1754-1824), a Massachusetts loyalist who went to New Brunswick after the American Revolution. He graduated at Harvard in 1805, and succeeded his father as agent for the crown in determining the northwest angle of Nova Scotia. After holding minor legal offices he became puisne judge of the supreme court 1825, and chief justice of New Brunswick 1834, president of the legislative council, and speaker of the assembly.

Chip'munk, an American ground-squirrel, a small animal of the genus *Tamias*, about six inches long, with a slender furred tail, nearly

as long as its body, and a coat of reddish-brown fur, striped with white on the back; from the marking it is called *Tamias striatus*. The eastern species has two white stripes, and the western chipmunk, *Tamias quadrivittatus*, which is exceedingly common all over the Rocky Mountain region, bears four stripes. The ground color also is extremely variable according to habitat. This little creature is often found frisking along stone walls, stopping now and again to sit erect and dart sharp glances at moving objects. It is generally shy in the presence of man, and escapes with great rapidity, when need arises, into some hiding-place. Its home is a burrow in some woodland place, tunnel-like in structure, sometimes fully 20 feet long, and always deep enough to be below the frost-line. It is enlarged into chambers at intervals. One of these, supplied with dried leaves, grass, and like material for bedding, is the sleeping apartment; the others are store-houses. In them the chipmunk stores his winter supplies of small nuts and acorns, especially the sweet beech-nuts. These he carries home, often several at a time, in his distensible cheek pouches. They are his chief food; but he will eat, also, buds, mushrooms, and insects. The breeding season is in May; and the young are usually from four to six in number. The chief enemies of the chipmunk are the fox and the weasel. The former is dangerous only in the open, as he is too large to disturb the chipmunk at home. But the weasel can attack him in his burrow; and, to escape him, the chipmunk makes an opening for possible escape, at the far end of his burrow. For consideration of the various species of *Tamias*, consult J. A. Allen, 'Bulletin of the American Museum of Natural History,' Vol. III.

Chippawa, chip'a wā, Canada, a village in the province of Ontario. It is situated at the confluence of the Chippawa and Niagara rivers, two miles above the Falls, and contains an extensive steam-engine manufactory, and one of the largest factories of stoves in the province. On 5 July 1814 the battle of Chippawa (q.v.) was fought here between the Americans and the British.

Chippawa, Battle of, 5 July 1814, an action in the War of 1812, remarkable for the defeat of a force of British regulars by an inferior number of Americans, in pitched battle on an open plain, without advantage of position, and with weaker artillery. Maj.-Gen. Riall, commanding the British forces, had about 1,500 line infantry—the King's regiment, the 100th, and the Royal Scots, with dragoons and artillerymen, and 600 skirmishers—north of the Chippawa River, which enters Niagara on the Canada side just above the rapids; the bridge from Chippawa village crossed it near its mouth. Joseph Brown's American force lay to the south beyond Streeter's Creek, and Brown started on the morning of the 5th to build another bridge across the Chippawa, to out-flank Riall, whose skirmishers crossed the river and harassed the work and the camp from the woods on the west, and Peter B. Porter's militia brigade was sent to drive them out. As it approached the river, Riall's army

CHIPPENDALE — CHIQUINQUIRA

crossed the bridge on its right flank, and it fled in panic, about 5 p.m. Riall thereupon deployed his force and advanced on the plain toward Brown. Scott's brigade of 1,300 was about crossing the creek bridge for a Fourth of July parade and, the creek being lined with woods, only learned of the danger at the last moment. Each side had three guns; but the British were two 24's and a 5½-inch howitzer, against the American three 12's. Scott's troops crossed the bridge under fire from the 24's, and coolly deployed beyond; while Scott threw his wings forward to avoid being out-flanked, the left wing reaching into the woods. Both sides advanced, with pauses to load and fire, till the flanks touched and the centres were 200 feet off; when the British, unable to endure the deadly musket-fire in front and the artillery now sweeping diagonally through the ranks, broke and ran for the Chippawa. The battle lasted less than an hour; and when Ripley's brigade came to Scott's help the plain was deserted by the enemy. Riall lost 137 killed and 305 wounded of the regulars, nearly a third of his entire force, besides 73 skirmishers; Scott, 48 killed and 227 wounded; and Porter, 22 more. The victory was won by superior musketry and artillery fire, as shown by the enormous disparity in killed; and by a leader under whom every private was a hero. Consult Henry Adams, 'History of the United States,' Vol. VIII., ch. 2.

Chippendale, Thomas, English cabinet-maker. He is supposed to have gone to London from Worcestershire before 1750. The style of furniture named from him was less heavy and severe than that of his successors, and was elaborate, delicate, and baroque, with classical tendencies. He wrote a 'Cabinet-maker's Director' (1752).

Chip'penham, England, a municipal borough of Wiltshire, 12¼ miles northeast of Bath, on the Avon, here crossed by an ancient stone bridge of 22 arches. It consists of one principal street, with others diverging from it. It contains two large parish churches with lofty spires, an old and a new town-hall, etc. The station of the Great Western Railway here is a very large one. The town is an important mart for cheese, and contains a woolen factory, a silk factory, large condensed-milk factory, railway works, boot factories, etc. Pop. (1901) 5,074.

Chippewa, chip'pē-wā. 1. Michigan, an eastern county of the upper peninsula, bordering on lakes Superior and Huron, and bounded east by the river St. Mary. The surface is hilly and partly covered with forests of pine. Capital, Sault Ste. Marie. 2. Wisconsin, a county bordering on the Mississippi River, traversed by the Chippewa and several affluents; area, about 4,300 square miles. Sandstone is abundant, and much of the surface is well wooded. Capital, Chippewa Falls.

Chippewa, a river of Wisconsin, which has its rise in the north of the State, and after receiving several tributaries flows southwest into Lake Pepin, an expansion of the Mississippi.

Chippewa Falls, Wis., town and county-seat of Chippewa County. It is on the Chippewa River, and the Chicago, M. & St. P., the Chicago, St. P., Minneapolis & O., and the Wisconsin

Cent. R.R.'s; 12 miles northeast of Eau Claire. It contains the County Insane Asylum, the State Home for the Feeble-Minded, and has important manufactures, large water power from the river, electric lights, and street railways, daily and weekly newspapers, two national banks, and an assessed property valuation of \$2,000,000. Pop. (1900) 8,094.

Chippeways, chip'pē-wāz, or **Ojibways**, a tribe of North American Indians in the United States and Canada. They are distributed in bands round both sides of the basin of Lake Superior, where they once owned vast tracts. They are of the Algonquin stock, tall, active, and well formed, subsist chiefly by hunting and fishing, and number about 18,000.

Chip'ping Spar'row (*Spizella socialis*), a common North American migratory bird allied to the chaffinch, some five or six inches long, whose song consists of about half a dozen notes uttered in quick succession. It is also called chipping bird, and chippy. It is also known as the hair-bird from its habit of lining its nest with horse-hair. In the nest, which is built in low trees or shrubs, are laid four or five blue eggs slightly speckled with brown. Two or three broods are raised during the season. The bird is naturally an eater of seeds, and has sometimes been known to destroy insects, but the evidence in favor of the contention that it is the friend of the farmer and gardener is hardly enough to warrant the encomiums of some writers.

Chips from a German Workshop, by F. Max Muller (5 vols.). A collection of special studies incidental to the author's editing of a library of the 'Sacred Books of the East.' The several volumes cover various fields, as follows: (1) 'The Science of Religion'; (2) 'Mythology, Traditions, and Customs'; (3) 'Literature, Biography, and Antiquities'; (4) 'Chiefly the Science of Language'; (5) 'Miscellaneous' and later topics. Although they are the result of 'occasional work,' their wealth of material and thoroughness of treatment, and the importance of the views presented, give them not only interest but permanent value. On many of the points treated, discussion is still open, and some of the views advanced by Prof. Muller may come into doubt; but his contributions to a great study will not soon lose their value.

Chiquichiqui (chē'kē-chē'kē) **Palm**, a native of Brazil, where it is called piassaba. It grows in swamps and along low river banks. Its leaves are used for thatching, and it is the source of a fibre which is used for making brushes.

Chiquimula, chē-kē-moo'lā, **Guatemala**, Central America, a small town in the east of Guatemala, 55 miles northeast of the city of New Guatemala. It is in a mountainous region, valuable mineral deposits near, and a delightful climate. Pop. 6,500.

Chiquinquira, chē-kēn-kē-rā', **Colombia**, South America, the largest town in the department of Boyacá, near the Suarez, 42 miles west of Tunja; was an Indian place of pilgrimage before the conquest. In one of the churches is a miraculous picture of the Virgin. Where it is preserved is now visited annually by some 60,000 pilgrims. Pop. 12,800.

CHIQUITOS—CHISHOLM

Chiquitos, chē-kē'tōz, a race or stem of Indians inhabiting western Bolivia. The chief occupation of the people when first discovered by the whites, was agriculture. They rejected Spanish rule and European customs until 1691, when the Jesuits established a mission among them. The soil here is rich, growing vanilla, indigo, cotton, sugar, etc.; but for want of markets there is little cultivation. The policy of the Jesuit missionaries has made the Chiquito language the predominant one among the natives. It is copious, and is said to have a separate vocabulary for female use. The size and decorations of the churches, and the perfection of the church music in which the natives take a part, are a curious monument of the perseverance of the Jesuit missionaries, which has succeeded in implanting in the midst of these solitudes a fragment of European civilization. In the year 1767 the Jesuits were expelled from the place, by Spanish authority. Since then the Chiquitos have not prospered, and their numbers have decreased. They still cultivate the soil, which is fertile, growing vanilla, indigo, cotton, sugar, etc.; but for want of markets there is little ambition to raise large crops. The native population is about 22,000, distributed among 10 missions.

Chiragra, kī'rāg-ra, that species of gout which attacks the joints of the hand (the wrist and knuckles) and hinders their motions. It gradually bends, distorts, and finally stiffens the fingers.

Chirata, chī-rā'ta, or **Chiretta**, *Ophelia Chirata*, a slender branching annual of the gentian family, two to three feet high, with yellow flowers. It is a native of India, where the dried stems are in repute as a tonic and febrifuge both with native and European practitioners.

Chiretta, chī-rēt'ta. See **CHIRATA**.

Chiriqui, chē-rē-kē', Panama, formerly one of the administrative divisions of Colombia, adjoining Costa Rica; area, 6,500 square miles. It is well wooded, and has rich pasturage, especially on the Atlantic coast, where the climate is very moist. The Cordilleras that occupy the interior reach their highest point in the volcano of Chiriqui (11,265 feet). Chief town, David. On the north coast is a spacious lagoon with a depth of water for the largest ships. Pop. 45,000.

Chirogale, kī'rō-gāl, or **MOUSE-LEMUR**, a small lemur of the genus *Chirogale*, native exclusively to Madagascar, especially *C. Coquereli*. It lives in trees and at the approach of the dry season curls up in a hollow place in a tree and sleeps until the rainless time is over. Like hibernating animals of cold regions, it accumulates a large deposit of fat before becoming torpid; and when it wakes it has regained its normal condition. It feeds on fruits and insects, and builds a nest somewhat like a bird's. Four other species are known whose habits are similar, generally, to those of the lemurs (q.v.), especially the galagos, to which they are closely allied.

Chiromancy, kī'rō-mān-sī. See **PALMISTRY**.

Chiron, kī'rōn, in Greek mythology, the son of Kronos (Saturn) and Philyra. Kronos assumed the shape of a horse, in this amour,

to deceive his wife, Rhea. The shape of Chiron, therefore, was half that of a man, half that of a horse. In point of fact, Chiron was one of the people called *Centaur*s. He was celebrated through all Greece for his wisdom and acquirements; and the greatest princes and heroes of the time were represented as his pupils. He was particularly skilled in surgery. When Hercules drove the Centaurs from Mount Pelion, they took refuge with Chiron in Malea; but their enemy pursued them even into this retreat, and unfortunately wounded his old teacher with a misdirected arrow. The speedy operation of the poison in which the arrow had been dipped rendered remedies useless; and Chiron suffered the severest torments. The gods at his prayer put an end to his life, though his nature was immortal by reason of his descent from Kronos. After his death he was placed among the stars, and became the constellation *Sagittarius*.

Chiroptera. See **CHEIROPTERA**.

Chiru, chī'roo, a large antelope (*Pantholops hodgsoni*) native to the plateau of Tibet, especially in pine forests. It is about 32 inches tall, and pale in color. The buck has a black face, and long horns like those of the gazelle. It is wary to a degree that makes the autumnal hunts of the natives a matter of patience as well as of skill. This fine antelope is related to the saiga of Eastern Russia.

Chisel, an edged tool for cutting wood, iron, or stone. It is operated by striking its upper end with a hammer or mallet, or by pressure. It is one of the most ancient of tools. Chisels of sharp flint have always been used by savages to cut wood, and in very early times bronze ones were made which would cut the hardest stone. The ancient Egyptians carved most of their granite monuments with copper or bronze chisels, which are said to have cut as well as the best steel chisels of the present day. Chisels are now made in many different forms and for many kinds of work. Those used by sculptors, masons, and other workers in stone are merely short pieces of steel with sharp edges. The tool is held in the left hand and is made to cut by striking it on the end with a broad hammer called a mallet, made usually of wood. Blacksmiths, and other iron-workers use chisels much like those of stone-cutters, for cutting off bars of iron and like work. Carpenters and joiners' chisels are much finer tools, and usually have handles. They are made out of bar iron by forging, or hammering it while hot, and the edge of tool steel, is put in in the same way as the edge of an axe. Such chisels are made of many sizes, from an eighth of an inch up to several inches in width, and are used for different kinds of wood-cutting and -carving. Dovetails, mortises, and other such work are usually cut with chisels. A kind of chisel with a rounded blade, used for cutting grooves and round places in wood, is called a gouge.

Chis'elmouth. See **CHUB**.

Chisholm, chīz'ūm, Mrs. **Caroline** (JONES), English philanthropist: b. Wootton, North-

amptonsire, 1808; d. 1877. In her 20th year she married an officer of the Indian army, with whom she proceeded to Madras. Prompted by the destitute condition of the orphans of British soldiers, she established and managed there, with happy results, a school for girls and a school of industry. In 1838 she removed with Capt. Chisholm to Australia, and at Sydney she found a new call upon her exertions in the numerous young women landed there in destitution from emigrant ships. Between 1841 and 1845, she procured employment for 11,000 persons, to whom she had lent in small sums £1,200, the whole of which, excepting £16, was repaid to her. She visited England in 1846; instituted the family colonization society, by which passage money was paid in weekly instalments; and in many ways planned to relieve emigrants of the poorer classes. She returned with her family to Australia in 1854.

Chisholm, William Wallace, American official: b. Morgan County, Ga., 6 Dec. 1830; d. De Kalb, Miss., 13 May 1877. In 1847 his family removed to Kemper County, Miss., and between 1858 and 1867 he was a justice of the peace and probate judge. During the Civil War he was a union man, but was continued in office, although regarded with suspicion by the Confederate authorities. After the war, a fusion of white unionists and negroes elected him sheriff. In 1877 a long standing personal and political feud between Chisholm and an opposing faction, led by John W. Gully, came to a head. On April 26 Gully was waylaid and murdered. His friends accused Chisholm and his party of being instrumental in bringing about the crime. Chisholm and four others were arrested on the morning of April 29; a mob entered the village and insisted that Chisholm, who was in his own house in the custody of the sheriff, should be lodged in the jail. His wife, daughter, and son accompanied him there; the jail was shortly after attacked by the mob: Chisholm and his daughter receiving wounds that later proved fatal, while the son was killed in his father's arms by a shot from one of the leaders of the assailants. One of the other prisoners, Gilmer, had previously been killed by the mob. In December, 1877, Walter Riley, a negro, confessed that he had murdered Gully, and denied any knowledge or complicity on the part of Judge Chisholm or the latter's associates. See Wells' 'Chisholm Massacre' (1878). 'Kemper County Vindicated' gives the Democratic side of the affair.

Chisholm v. Georgia, in the United States supreme court, the case which led the several States to protect themselves from legal responsibility to individuals, while retaining legal powers of aggression. The Constitution provides (Art. iii., sec. 2): "The judicial power shall extend to all cases—between a State and citizens of another State." Under this provision Maryland was sued soon after the adoption of the Constitution, and acknowledged process by her attorney-general; but the case was compromised, and the question of jurisdiction did not come up. On 11 July 1792, Alexander Chisholm of South Carolina, as legatee in an inheritance case, served a process on the governor and attorney-general of Georgia to appear before

the August term of the supreme court. Georgia instructed its attorney-general not to appear, and its counsel to enter a denial that States could be sued by individuals, or that the supreme court had jurisdiction in such cases, but not to argue the case. Chief Justice Jay, and all the court except Iredell of North Carolina, found that the court had such jurisdiction; and a writ of inquiry was issued, but not served because Georgia passed an act making service of it a capital offense. Virginia was as angry as Georgia; and the Eleventh Amendment to the Constitution was introduced into Congress, passed by two thirds of both Houses, 5 March 1794, ratified by the States, and declared in force, 8 Jan. 1798. It reads: "The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign state." This leaves the constitutional provision hanging in the air, unless construed as meaning "between a State *as plaintiff* and citizens of another State"; and thus the southern Confederacy made the corresponding article of its constitution read.

Chislehurst, chîz'el-hêrst, England, a village in west Kent, with an ancient parish church, two district churches, Roman Catholic church, etc. The mansion of Camden Place was occupied from 1871 by Napoleon III, and the Empress Eugénie, and the former died there in 1873. There is a Runic cross in memory of the Prince Imperial. The remains of Napoleon III. and his son were removed from there to Farnborough in 1888. Pop. (1901) 7,429.

Chisleu, kîs-loo, or **Kislev**, the ninth month of the Jewish year, commencing with the new moon in December or the latter part of November. See **KISLEV**.

Chiswick, chîs'îk, England, a town and parish of Middlesex, six miles west of Hyde Park Corner, London. It has an ancient church, with Hogarth's tomb in the churchyard, and several schools, contains the gardens of the Royal Horticultural Society, and Chiswick House, in which Fox and Canning died. There are engineering works, breweries, market-gardens, etc. Pop. (1901) 29,809.

Chitaldrug, chî't-ûl'droog', or **Chitteldroog** (native, *Sitala Durga*, spotted castle), India, a town and fortress, capital of a district of the same name in the Nagar division of Mysore. The town is 126 miles northwest of Bangalore, and the fortress, occupying a cluster of rocky hills about 800 feet high, consists of a labyrinth of fortifications winding irregularly up from rock to rock to the summit, and guarding every accessible point. Inside the fortifications are a number of temples. The modern town stands at the northeastern base of the hills. Pop. 5,000.

Chitin, or **Chitine**, kî'-tin ($C_{15}H_{23}N_2O_{10}$), the horny substance which gives firmness to the tegumentary system and other parts of the *Crustacea*, *Arachnida* and insects; probably also the carapace of the *Rotatoria* consists of it. It is left when the above structures are exhausted successively with alcohol, ether, water, acetic acid, and alkalies. It is colorless and amorphous,

CHITON — CHITTENDEN

and is usually classed a proteid. It is dissolved by concentrated mineral acids without the production of color. It is not dissolved by solution of potash, even when boiling; neither does it give the characteristic reactions with Milton's or Schultze's tests.

Chiton, ki'tôn, a genus of *Mollusca* and the common name of the same, the shells of which are boat-shaped, and consist of a median series of symmetrical plates, folding over each other, and implanted in the mantle, the marginal zone of which is studded with spicules. It is the typical genus of the family *Chitonida* of the class *Amphineura*.

This class is remarkable among the *Mollusca* in having certain of the organs distinctly segmented. The body is sole-shaped, symmetrical, and without distinct head or tentacles, but with a lateral fringe of gills. No eyes corresponding to those of snails are present, but very numerous eyes are scattered all over the back. The alimentary canal is much like that of a snail, being much convoluted, and provided at the anterior end with a muscular tongue and toothed radula. On the other hand the nervous system is unique in consisting of two pairs of longitudinal ganglionated cords, one of which, the pedal pair, is provided with transverse connective at intervals.

The chitons cling firmly to rocks, etc., by means of the powerful foot, many of them resisting the heaviest beat of the surf. Only very small species (*Chatapleura*, etc.) are found on the eastern Atlantic coast, but larger species occur in Florida and the Gulf of Mexico, while California has the giants of eight or ten inches of the genus *Cryptochiton*. Consult Hubrecht, 'Quarterly Journal of Microscopical Science,' 1882.

Chiton, ki'tôn, the undergarment of the ancient Greeks. In the earliest times it was worn by the men only; in later times there were two forms, and the chiton was worn by both sexes. The Dorian chiton was sleeveless, reaching about to the knees, and usually left more or less open on the right side. The Ionian was a long tunic reaching to the feet, closed on the sides, sometimes sleeveless, but often with short or long sleeves. Both forms were usually worn belted in at the waist.

Chit'or, or **Chittore**, India, a town and fort of Hindustan, in the native state of Oodeypore, Rajputana, on the Gamneri River, about 70 miles northeast of the town of Oodeypore. The town was for several centuries capital of Oodeypore, and was far more prosperous and wealthy than it is at present. It still contains many temples and other well-constructed buildings. The fort, formerly considered one of the strongest in India, stands upon a high rock overlooking the town. Pop. 11,000.

Chitra. See **AXIS-DEER**.

Chitral, chit-rāl', British India, a native state, having Yasin and Gilgit on the east, Swat, Dir, and Bajaur on the south, Kafiristan on the southwest, and the Hindu Kush mountains on the north and northwest. Through it flows in a southwest direction the Chitral or Kunar or Kashkar River, a tributary of the Kabul, and on it, in about lat. 36° N., stands the town of Chitral at a height of more than 5,000 feet above sea-level. The people are Moslems, but

mostly speak a language closely akin to that of their pagan neighbors in Kafiristan. Upper Chitral, with its capital Mastuj, is closely connected with Gilgit. Lower Chitral enjoyed till recent times undisturbed independence; but in 1894 an English resident and small body of troops were surrounded and besieged in Chitral, the consequence of which was that in March 1895 an expedition was sent (the main body by the Swat valley, the other from Gilgit), which after some sharp fighting advanced triumphantly through extremely difficult country, relieved the besieged, and annihilated all opposition.

Chittagong, chit-ta-gōng', India, district in the presidency of Bengal, Hindustan. The district has Tipperah on the north, the Chittagong Hill Tracts on the east, Arracan on the south, and the Bay of Bengal on the west. Its area is 2,563 square miles, and it has a population of about 1,300,000. The Blue Mountains, on the northeast, attain a height of 5,600 feet. The principal river is the Karnaphuli, or Chittagong. The level lands, chiefly on the coast, and the valleys are very fertile. The principal exports are timber, canvas, coarse cloths, and elephants. A considerable majority of the inhabitants are Mohammedans. The city of Chittagong, the capital of the district, is situated on the right bank of the Karnaphuli, 12 miles from its mouth and 220 miles east of Calcutta, and is the second port of Bengal. It consists of a series of detached houses on little hills. Although its climate is unhealthy, it is an important industrial and trade centre, among its exports being rice, jute, jute manufactures, and tea. Pop. 25,000.

Chittagong Wood, the wood of several Indian trees, especially of *Chickrassia tabularis*. It is a light-colored beautifully grained wood used by cabinet-makers. It is light in weight but does not wear well in changeable climates, as it warps in dry weather. The wood of *Cedrela Toona* receives the same name.

Chit'tam-wood, or **American Smoke-tree** (*Continus cotinoides*), belongs to the sumac family. It is a small tree with wide spreading branches growing to the height of about 40 feet. It flourishes during the months of April and May in Tennessee and Alabama and westward to Missouri and Indian Territory. A rich dye for commercial use is extracted from the orange-yellow wood, which weighs about 40 pounds to the cubic foot.

Chit'tenden, Hiram Martin, American military engineer: b. New York 25 Oct. 1858. He has supervised engineering government works in the Yellowstone National Park and elsewhere, and has published 'The Yellowstone National Park: Historical and Descriptive' (1893); 'Reservoirs in the Arid Regions' (1897); 'Reservoir System of the Great Lakes' (1898); 'The American Fur Trade of the Far West' (1901).

Chittenden, Russel Henry, American educator: b. New Haven, Conn., 18 Feb. 1856. He was graduated at Yale in 1875, and took a course at Heidelberg. He became professor of physiological chemistry at Yale in 1882, and since 1896 has been director of the Sheffield Scientific School. He has written 'Digestive Proteolysis'; 'Studies in Physiological Chemistry,' and similar works.

Chittenden, Thomas, American colonial and State governor: b. East Guilford, Conn., 6 Jan. 1730; d. Williston, Vt., 24 Aug. 1797. He was one of the pioneers of Vermont, settling upon the New Hampshire grants in 1774, and acquiring a fortune from his lands. In 1778 he became Governor of Vermont, before its formal separation from New York was recognized. During the Revolutionary War the English and the Continental Congress received overtures from him, his terms being recognition of Vermont's statehood. He retired from public life in 1796.

Chittim. See **KITTIM**.

Chittoor, chit-toor', or Chittur, India, a town, capital of North Arcot district, Madras. It contains courts and public offices, an English church and a Roman Catholic chapel. Pop. 10,000. There is a town of the same name in the state of Cochin, Madras, with about the same population.

Chit'ty, Joseph, English lawyer and legal writer: b. 1776; d. London 17 Feb. 1841. He acquired great reputation by his legal text-books. These comprise a 'Treatise on Bills of Exchange' (1799); 'Treatise on the Parties to Actions and to Pleadings' (1808); 'Treatise on the Law of Nations Relative to the Legal Effects of War on the Commerce of Belligerents and Neutrals' (1812); 'A Practical Treatise on the Criminal Law, Adapted to the Use of the Profession, Magistrates, and Private Gentlemen' (1816); 'Treatise on Commercial Law' (1818); 'Collection of the Statutes of Practical Utility' (1829-37); 'Treatise on Medical Jurisprudence' (1834).

Chiusi, kē-oo'sā, Italy, a town in the province of Siena, 102 miles north-northwest of Rome, on an olive-clad eminence in the Val di Chiana, not far from the small Lago di Chiusi. In ancient times, under the name of Clusium, it was one of the 12 republics of Etruria, and the residence of Porsenna. When Italy was overrun by the barbarians, it fell into decay, the whole valley was depopulated, and became the pestilential pool described by Dante. Since the improvement of the course of the Chiana, Chiusi has begun to flourish again along with the whole district. It is in connection with the discovery of Etruscan antiquities, however, that the place is chiefly heard of. During the 19th century immense quantities of these remains were found in the neighborhood in the grottoes that served the ancient Etruscans as tombs. They consist chiefly of sun-dried black earthenware vases, ornaments, reliefs, and carved stonework, and are preserved in the museums at Chiusi and Florence.

Chivalry (Fr. *chevalerie*, from *cheval*, Lat. *caballus*, 'a horse'), a term which indicates strictly the organization of knighthood as it existed in the Middle Ages, and in a general sense the spirit and aims which distinguished the knights of those times. The chief characteristics of the chivalric ages were a warlike spirit, a lofty devotion to the female sex, a love of adventure, and a thirst for glory.

To explain the nature and origin of chivalry we must consider the character of the ancient German tribes. The warlike spirit was common to them with other barbarous nations; but there were certain traits in their character pe-

culiarly their own. Among these was their esteem for women. This is dwelt upon by Tacitus, and is sufficiently apparent from the early native German historians. This regard for the female sex was diffused by them through every country into which they spread, though with considerable difference in the forms in which it developed itself. In France it became that refined gallantry for which the nation has been so long conspicuous; in Spain it assumed a more romantic and glowing character, displaying much of the fire of Oriental feeling; in Germany itself it became faithful and tender attachment to the wedded wife. Engrafted upon this primitive regard for woman amongst the Germanic tribes, the moral and æsthetic principles of the Christian Religion, its ideals of chastity, marriage and loyalty, and in particular the widespread veneration paid to the Virgin Mother of Christ, powerfully contributed to the development of the institutions of chivalry. We may be told, in answer to our claim of the peculiar regard for the female as a characteristic of the Teutonic tribes, that women were held in high esteem by the Romans. It is true that wives and mothers were treated with great regard by the Romans, and the history of no nation affords more numerous instances of female nobleness; but this esteem was rendered to them, not as females, but as the faithful companions and patriotic mothers of citizens. It had somewhat of a political cast. But this was not the case with the Germans. There is another trait of the German character which deserves to be considered in this connection, which is very apparent in their literature, and the lives of many individuals; we mean that indefinite thirst for something superior to the realities of life, that *sehnen*, to use their own word, which hardly admits of translation, which has produced among them at the same time so much excellence and so much extravagance. These three traits of the Teutonic race, their warlike spirit, their esteem for women, and their indefinable thirst for superhuman greatness, together with the influence of the feudal system and of the Roman Catholic religion, afford an explanation of the spirit of chivalry—an institution which, to many observers, appears like an isolated phenomenon in history, and leaves them in doubt whether to despise it as foolish or admire it as sublime. The feudal system divided the Christian Teutonic tribes into masses, the members of which were united, indeed, by some political ties, but had little of that intimate connection which bound men together in the communities of antiquity, and which has produced like effects in our own and a few preceding ages. They still preserved, in a great measure, the independence of barbarians. There was, however, one strong bond of union which gave consistency to the whole aggregate; we mean the Roman Catholic religion. The influence of a common religion was of great service to mankind, during the ages of turbulence and violence, in giving coherency to the links of the social chain, which were continually in danger of parting. To this cause is to be ascribed the great uniformity of character which prevailed during the ages of chivalry. The feudal system, besides, enabled the gentry to live on the labors of the oppressed peasants without the necessity of providing for their own support, and to indulge the love of adventure incident to their warlike and ambitious

CHIVASSO

character. If we now combine the characteristics which we have been considering—a warlike spirit, a lofty devotion to the female sex, an undefinable thirst for glory, connected with feudal independence, elevation above the drudgery of daily toil, and a uniformity of character and purpose, inspired by the influence of a common religion—we obtain a tolerable view of the chivalric character. This character had not yet quite developed itself in the age of Charlemagne. The courage exhibited by the warriors of his age was rather the courage of individuals in bodies. The independence, the individuality of character, which distinguished the errant knight who sought far and wide for adventures to be achieved by his single arm, was the growth of a later period. The use of the war-horse, which formed so essential an instrument of the son of chivalry, was not common among the Germans until the time of their wars with the Huns. They were, indeed, acquainted with it before, and Tacitus mentions it in his account of Germany; but it was not in common use among them till the period we have mentioned. After it was introduced, cavalry was considered among them, as among all nations in the early stages of their progress, much superior to infantry, which was, in fact, despised, until the successes of the Swiss demonstrated its superiority. In the 11th century knighthood had become an established and well-defined institution; but it was not till the 14th that its honors were confined exclusively to the nobility. The Crusades gave a more religious turn to the spirit of chivalry, and made the knights of all Christian nations known to each other, so that a great uniformity is thenceforward to be perceived among them throughout Europe. Then arose the religious orders of knights, the knights of St. John, the Templars, the Teutonic knights, etc. The whole establishment of knighthood assumed continually a more formal character, and, degenerating, like every human institution, sank at last into quixotic extravagances, or frittered away its spirit amid the forms and punctilios springing from the pride and the distinctions of the privileged orders of society. It merged, in fact, among the abuses which it has been one of the great labors of our age to overthrow. The decline of chivalry might be traced through the different forms which it assumed in different nations as distinctly as its development—a task too extensive for this work.

The education of a knight was briefly as follows: The young and noble stripling, generally about his 12th year, was sent to the court of some baron or noble knight, where he spent his time chiefly in attending on the ladies and acquiring skill in the use of arms, in riding, etc. This duty of waiting about the persons of the ladies became, in the sequel, as injurious to the morals of the page as it may have been salutary in the beginning. When advancing age and experience in the use of arms had qualified the page for war, he became an *escuyer* (esquire or squire). This word is generally supposed to be derived from *escu* or *scudo* (shield, *scutum*), because among other offices it was the squire's business to carry the shield of the knight whom he served. The third and highest rank of chivalry was that of knighthood, which was not conferred before the 21st year, except in the case of distinguished birth or great achievements. The individual prepared himself by confessing,

fasting, etc.; religious rites were performed; and then, after promising to be faithful, to protect ladies and orphans, never to lie or utter slander, to live in harmony with his equals, etc. (in France there were 20 vows of knighthood), he received the *accolade*, a slight blow on the neck with the flat of the sword from the person who dubbed him knight, who at the same time pronounced a formula to this effect: "I dub thee knight, in the name of God and St. Michael (or in the name of the Father, Son, and Holy Ghost). Be faithful, bold, and fortunate." This was often done on the eve of battle, to stimulate the new knight to deeds of valor, or after the combat, to reward signal bravery.

Though no man of any reflection would wish for the return of the age of chivalry, yet we must remember that chivalry exercised, in many respects, a salutary influence at a time when governments were unsettled and laws little regarded. Though chivalry often carried the feelings of love and honor to a fanatical excess, yet the reverence paid to them contributed to prevent mankind, at this period of lawless violence, from relapsing into barbarism; and as the feudal system was unavoidable, it is well that its evils were somewhat alleviated by the spirit of chivalry. The influence which chivalry had on poetry was very great. The *troubadours* in the south of France, the *trouvères* in the north of the same country, the "minstrels" in Great Britain, the *minnesinger* in Germany, sang the achievements of the knights who received them hospitably. In Provence arose the "Courts of Love," which decided the poetical contests of the knights. At these, amorous songs (*chansons*), duets (*tensons*), pastoral songs (*pastourelles*), and poetical colloquies (*sirventes*), were performed. In Germany the chivalric spirit produced one of the most noble epics, the 'Nibelungenlied' (q.v.). It was the spirit of chivalry which led to the Crusades, and from the intercourse with the East which grew up during this period the wonders of Oriental enchantment were introduced into the romantic or chivalric poetry, and European literature received a great stimulus. Chivalric poetry, however, existed apart from any influence of this kind, and really begins with the mythological cyclus of King Arthur's round table and the feats of his knights, which furnished materials that found poetic treatment in various European countries. A second cyclus is that of Charlemagne and his paladins, his 12 peers, which remained a poetical foundation of chivalric poetry for many centuries. Alexander the Great also became a great hero of chivalric poetry. The cyclus of Amadis, which belongs, perhaps, exclusively to Spain, does not rest on any historical ground. For further information see the essay on chivalry, originally in the 'Encyclopædia Britannica,' written by Sir Walter Scott; Heeren's 'Essay on the Influence of the Crusades'; 'Mémoires sur l'Ancienne Chevalerie, par Lacurne de Sainte-Palaye' (2 vols., with engravings); Gautier's 'La Chevalerie'; Henne am Rhyn's 'Geschichte des Rittertums'; and 'Don Quixote.' See also DUELLING; MIDDLE AGES; TOURNAMENT.

Chivasso, *kē-vās'sō*, Italy, a town on the Po, 14 miles northeast of Turin. It was formerly strongly fortified, and contained the residence of the dukes of Montferrat. Pop. 10,000.

CHIVE—CHLORAL

Chive, or Cive, a perennial herb (*Allium Schanoprasum*), of the natural order *Liliaceae*. It is a native of Europe, Asia, and the northern parts of North America, but has been introduced in temperate climates as a vegetable. It has small, flat, clustered bulbs which multiply laterally to form clumps. The leaves, which grow in dense profusion, are tubular, five to eight inches long; and the flowers, which are borne in umbels, are purplish, pinkish, or violet. Aside from the use of the leaves as a flavoring for soups, stews, salads, etc., the plants are frequently used for ornamental purposes, since they make excellent edgings for flower-beds. They are readily propagated by division, a process that should be performed as soon as the clumps become very dense. The plants do well in any good garden soil with no attention except weeding, and they may be clipped for use frequently during the growing season. Their flavor resembles that of onions.

Chizerots (shē-zè-rō) and **Burins**, bū-rān, one of those peculiar races in France that live isolated in the midst of the rest of the population, and are despised and hated by their neighbors. They are found in the arrondissement of Bourgen-Bresse, in the department of Ain; and the communes of Sermoyer, Arbigny, Boz, and Ozan belong to them. According to tradition, they are descended from the Saracens. Though industrious and prosperous, they are held in the utmost contempt and detestation by their peasant neighbors, often themselves indolent and destitute. They are looked upon as covetous and malicious, and scarcely would the daughter of a small farmer or well-to-do day-laborer become the wife of one of them, so that they mostly marry among themselves. From time immemorial, they have been field-laborers, cattle-dealers, butchers, and the like. Many of them are very good-looking, the young women in particular being handsome and clear-complexioned, with large black eyes.

Chladni, klād'nē, **Ernst Florens Friedrich**, German physicist, one of the founders of the science of acoustics: b. Wittenberg 30 Nov. 1756; d. Breslau 4 April 1827. He adopted the profession of jurisprudence, which he practised first in his native town, and afterward at Leipsic, but his natural taste led him to study music, and to devote his leisure to physical science. The backward state of the theory of music compared with the other physical sciences early opened up to him a neglected mine of scientific discovery; and at the age of 19 he set himself resolutely to investigate it. By covering plates of glass with fine sand, and causing them to vibrate, he discovered the fundamental fact in the science of acoustics, that the communication of vibrations in material bodies is subject to constant mathematical laws. See **SOUND**. His scientific investigations led him to travel through the principal countries of Europe and visit its principal capitals. He invented the euphone about 1789 and clavicylinder 1800, instruments more curious than useful, in which musical sounds are produced by friction, and by the revolution of a glass cylinder causing the vibration of chords. His scientific works are of quite a different value. The first of them, 'Entdeckungen über die Theorie des Klanges,' appeared in 1787; 'Acoustics' (which he himself translated into French, 1809), in 1802; 'Neue

Beiträge zur Akustik,' (1817); 'Ueber Feuer meteore,' (1820).

Chladni Figures. See **SOUND**.

Chlamydosaurus, klām-ī-dō-sā'rūs. See **FRINGED DRAGON**.

Chlamydophorus, a genus of armadillos, containing the pichiciago. See **ARMADILLO**.

Chlamys, klā'mīs. (1) In ancient Greek costume, a light and freely flowing scarf or plaid, worn as an outer garment. It was oblong in shape, generally twice as long as its width, and was worn, according to taste or circumstances, in different ways. The chlamys of the youth was probably of a yellow color, while that of the soldier was scarlet. It was also carried by hunters and travelers, and some Romans are recorded as having adopted it. (2) In zoology, the name of a genus of coleopterous insects, belonging to the sub-tribe *Cyclica*, and the family *Chrysomelida*. There are but few North American species, and none of large size.

Chloasma, klō-az'ma, a peculiar pigmentation of the skin, of a yellowish, brownish to blackish shade, and due to a number of causes: (1) mechanical; (2) chemical; (3) thermal; (4) parasitic. Scratching is one of the most frequent mechanical causes. The irritants of mustard plasters, capsicum, cantharides,—all may cause an abnormal skin pigmentation. Sunburn is a frequent cause, a bringing out of the spots with greater vividness. Parasitic fungi have been known to cause it. In addition there are a large number of miscellaneous conditions associated with these liver spots. Pregnancy, menstruation, constipation,—one or all may emphasize their characters. Certain diseases, such as syphilis, Addison's disease (q.v.) in particular, and forms of anæmia are associated with excessive pigmentation. In only a small proportion of the cases has the liver anything to do with the condition.

Chlopicki, hlō-pīt'skē, **Joseph**, Polish general: b. Galicia 24 March 1772; d. Cracow 30 Sept. 1854. He served under Kosciuszko, during the first revolt of the Poles (1794), and then engaged in Napoleon's service, under whom he took part in the battles of Eylau, Friedland, Smolensk, and Moskowa. After the fall of Paris in 1814, he conducted back to Poland the débris of the Polish-French contingent, and was created general of division by the czar. On the outbreak of the Polish revolution of 1830, he was elected dictator, but soon resigned that office, fought at Grochow and Wavre, and after the cessation of hostilities, retired into private life.

Chlo'ral, a chemical substance resembling aldehyde in many of its properties, and obtainable from aldehyde by the action of chlorine gas. In its practical manufacture, however, it is formed by passing chlorine through cold absolute alcohol; a crystalline alcoholate of chloral is thereby formed, from which the chloral itself is afterward set free by the action of sulphuric acid. Chloral is a colorless liquid at ordinary temperatures, having the formula CCl_3CHO . It freezes at about -100°F ., and boils at 208°F . It combines directly with water, forming chloral hydrate (q.v.), $\text{CCl}_3\text{CH}(\text{OH})_2$, which is the substance commonly but incorrectly called "chloral."

CHLORAL HYDRATE—CHLORINE

Chloral Hydrate, a crystalline solid composed of trichloral aldehyde with one molecule of water. The crystals are single, colorless, and transparent rhomboids with an aromatic penetrating and smarting taste and slightly acrid odor. They are freely soluble in water, alcohol, and ether. Chloral hydrate is a powerful germicide but is rarely used as such save to preserve anatomical preparations. It is a vesicant and a local analgesic. In small doses it causes burning sensations of the stomach, but little general action. Full medicinal doses, 5 to 15 grains, cause a slowing of the pulse, dilatation of the arterioles, lowering of blood pressure, and slowing of the respiration. On the nervous system it acts as a depressant, causing sleep by direct action on the brain cells. Large doses cause poisoning with symptoms of collapse, coma with a feeble, thready pulse, lowering of temperature, cyanosis or lividity, cold perspiration, dilated pupils, and loss of reflexes. Death results from respiratory and cardiac paralysis. Treatment of poisoning is by rousing patient to maintain respiratory centre, artificial heat, artificial respiration, hot coffee by mouth or rectum, and cardiac stimulants. Chloral is particularly valuable in insomnia from overwork and in many of the convulsive disorders, titany, myoclonus, status epilepticus, and delirium tremens. Its action is possibly due to the formation of chloroform in the general circulation, by the action of the alkalis contained in the blood, in accordance with the equation $\text{CCl}_3\text{CH}(\text{OH})_2 + \text{KOH} = \text{CHCl}_3 + \text{H}_2\text{O} + \text{CHO.OK}$, the last formula in this equation being that of potassium formate. It is also useful in states associated with high arterial tension if the heart is not weakened. Within recent years a large number of allied drugs have been introduced. They have similar actions but are more palatable or are thought to cause less heart depression. Among these may be mentioned, chloralamid, chloretone, chloralose, and urethan.

Chloralamide, klō-rāl'a-mīd, or **Chloral Formamide**, fōr'mā-mīd, a substance formed by the action of formamide upon chloral, and usually obtained in lustrous, colorless crystals with a slightly bitter taste. It has the chemical formula $\text{CCl}_3\text{CH}(\text{NHCHO})_2$ melts at 240°F. , and is soluble in 20 parts of water and in a much smaller quantity of alcohol. It is not decomposed by dilute acids, but is decomposed by alkalis, and also by water at temperatures above 140°F. See also **CHLORAL**.

Chloralimide, klō-rāl'i-mīd, a substance occurring in long, colorless, needle-like crystals, with the formula $\text{CCl}_3\text{CH}:\text{NH}$. It is insoluble in water, but dissolves readily in alcohol, ether, and chloroform. It is used in medicine as an antipyretic and analgesic, and must not be confounded with chloralamide (q.v.).

Chlorastrolite, klō-ras'-trō-lit, a mineral found in the form of rounded pebbles on the shores of Isle Royale, Lake Superior, and derived from the trap rock in the vicinity. It is bluish-green in color, with a hardness of 5.5 and a specific gravity of 3.18. According to Hawes it is an impure variety of prehnite, but for optical reasons Lacroix classes it under thomsonite. Its name is from the Greek and signifies "green star," in allusion to its color and its stellated structure.

Chlo'rates. See **CHLORIC ACID**.

Chloric Acid, a colorless, strongly acid liquid, having the formula HClO_3 , and a specific gravity of 1.28. It combines with bases to produce the salts known as chlorates. Potassium chlorate is formed directly when chlorine gas is passed through a warm, concentrated solution of caustic potash. By treating this salt with sulphate of ammonia and adding barium hydrate, barium chlorate, $\text{Ba}(\text{ClO}_3)_2$, is formed, from which chloric acid is set free by the action of sulphuric acid. Chloric acid has powerful bleaching properties, owing to the facility with which it parts with its oxygen. Paper that is dipped into a strong solution of the acid takes fire spontaneously upon drying. The most important salt of chloric acid is potassium chlorate, which is largely used in the preparation of oxygen gas, in the manufacture of matches, and in medicine. It crystallizes in monoclinic plates having a specific gravity of 2.35.

Chloric Ether, a name given (1) to spirits of chloroform, a liquid consisting of one part of chloroform to nine of alcohol, and (2) to chloride of ethyl, $\text{C}_2\text{H}_5\text{Cl}$, which is obtained by passing dry hydrochloric acid gas through alcohol.

Chlorides. See **HYDROCHLORIC ACID**.

Chlorim'etry, the art of estimating the quantity of chlorine present in bleaching-powder or any other hypochlorite. Several methods are employed, depending for their success upon the oxidizing power of chlorine. See **CHEMICAL ANALYSIS**.

Chlorine, klō'rīn, a gaseous element, discovered in 1774 by Scheele, who named it dephlogisticated marine acid. The term "dephlogisticated" had exactly the same import as "oxygenated," which was soon afterward introduced by Lavoisier. Davy showed that the substance is not a compound of oxygen, but a simple body or element, and from its peculiar yellowish-green color the name "chlorine" was given to it. Chlorine gas is obtained by heating a mixture of hydrochloric acid and finely powdered peroxide of manganese, and may be collected either in bottles over warm water in the pneumatic trough, or by simply leading the delivery-tube to the bottom of the collecting-bottle, and allowing the chlorine to displace the air. The reaction is

Deacon's process for the commercial manufacture of chlorine consists in passing a mixture of hydrochloric acid gas and hydrogen over tiles that are soaked in a copper salt, and then dried and heated to a temperature of about 700° to 750°F. At this temperature the hydrochloric acid gas is decomposed with the formation of water and liberation of chlorine; the copper salt being apparently unaffected by the action. Chlorine is now largely (and perhaps chiefly) manufactured by the electrolysis of a solution of chloride of sodium (common salt).

Under ordinary atmospheric conditions chlorine is gaseous, but it condenses into a mobile yellow liquid at a pressure of about four atmospheres. It also liquefies at the ordinary atmospheric pressure at about 28°F. below zero. It has the chemical symbol Cl , and its atomic weight is usually given as approximately 35.4 for $\text{H}=1$. It is two and a half times heavier

CHLORINE

than atmospheric air, and has an insupportable suffocating odor. When pure it occasions immediate death to an animal immersed in it; but even when largely diluted with common air it cannot be respired with safety. It occasions a severe sense of stricture at the breast, which renders it impossible to make a full inspiration. Chlorine is somewhat soluble in water, the solution having the color and odor of the gas. If the solution be cooled, long yellow crystalline needles deposit, consisting of a hydrate of chlorine. When exposed to sunlight the solution gradually loses its color, oxygen is liberated, and the water contains hydrochloric acid in solution. The great affinity of chlorine for hydrogen is one of its most characteristic properties, and is exhibited in a number of reactions. If equal volumes of hydrogen and chlorine gas be mixed in the dark and then exposed to diffused daylight, gradual combination takes place; and if the mixture be exposed to direct sunlight the gases combine at once with an explosion and produce hydrochloric acid. This is the only compound these substances form with each other, and it is one of the most important of the acids. When a lighted taper is immersed in a jar of chlorine, it burns with a smoky flame; this is due to the combination of the chlorine with the hydrogen only, and the liberation of the carbon. Similarly, when hydro-carbons like turpentine and olefiant gas are mixed with chlorine and a light applied, a ruddy flame with a copious deposition of carbon shows that the hydrogen and chlorine are alone combining. Several of the elements catch fire when immersed in chlorine, for instance, phosphorus, arsenic, antimony, and copper; while others combine with it at a higher temperature, sometimes with vivid combustion as in the case of potassium. The binary compounds of chlorine with the other elements are termed chlorides, and next to the oxides they are the most abundant and widely distributed substances in the earth, many of them being also of great importance for manufactures. Common salt, the chloride of sodium, is the most plentiful of all, and forms large rock masses in various parts of Europe, and occurs dissolved in the waters of the ocean and of many salt lakes. It is the ultimate source of all the hydrochloric acid and chlorine of commerce. Other chlorides, as of potassium, calcium, etc., are met with, but in no case nearly so abundantly as common salt. As a class, the metallic chlorides are crystallizable salts, readily soluble in water, some being even deliquescent. The chloride of silver, the subchloride of mercury, and one or two others are, however, insoluble in water, while a few are decomposed by water. From its wide affinities and great activity in the free state, chlorine is one of the most useful and powerful instruments with which the chemist deals. By it such metals as platinum and gold are attacked and made soluble in water, while its power over organic substances is very great, and has resulted in the formation not only of a number of compounds by simple union with it, but of a great number into which the chlorine has entered more intimately and produced what are called substitution compounds.

Chlorine is largely consumed in the arts. Thus it is used in the manufacture of potassic chlorate, in the conversion of the yellow to the red prussiate of potash, in the preparation of chloride of sulphur for vulcanizing, and above all

as a bleaching and disinfecting agent. This last property is exercised by chlorine by virtue of its power of decomposing water by combining with the hydrogen and liberating oxygen, which latter substance is the true agent in the operation, and which converts the coloring matter into colorless compounds. Berthollet was the first to apply chlorine to the process of bleaching. The method of using it has been successively improved. It consisted at first in subjecting the thread or cloth to be bleached to the action of the gas itself; but the effect in this way was unequally produced, and the texture was sometimes injured. It was then applied in a dilute aqueous solution. The thread or cloth was prepared as in the old method of bleaching, by boiling first in water and then in alkaline lye; it was then immersed in the diluted chlorine, and this alternate application of alkali and chlorine was continued until the color was discharged. The offensive suffocating odor of the gas rendered this mode of using it, however, scarcely practicable; but the odor was found to be removed by a weak solution of potash; lime immersed in water, being more economical, was afterward substituted. Later a compound of chlorine and lime was employed, prepared by exposing slaked lye to chlorine gas; the gas is quickly absorbed by the lime, and the chloride of lime, or bleaching-powder, as it is called, being dissolved in water, forms the bleaching-liquor now generally employed. (See BLEACHING-POWDER.) In using it the cloth is first commonly steeped in warm water to clean it, and is then repeatedly washed with an alkaline solution so diluted that it cannot injure the texture of the cloth; the cloth is then washed and steeped in a very weak solution of chloride of lime, again washed, acted on by a boiling lye as before, and again steeped in the solution; and these operations are performed alternately several times. The cloth is lastly immersed in very dilute acid, which reacts on the bleaching-powder and liberates chlorine; this then attacks the coloring matter, and the cloth soon acquires a pure white color. It is next repeatedly washed with water to remove the last traces of the lime salts, and then it is exposed to the action of a hyposulphite in order to render inoperative any chlorine that may remain. (See ANTI-CHLOR.) The cloth is finally washed, dried, and dressed. When sulphuric acid is used to liberate the chlorine it is found more difficult, in the subsequent washing, to remove the calcic sulphate formed, on account of its sparing solubility in water. To avoid this, chloride of magnesia has been substituted for the chloride of lime. It is easily prepared by adding sulphate of magnesium to a solution of chloride of lime and straining off the clear fluid. It has the same bleaching power, is easily removed by washing, and is said to leave the cloth in a more supple state than when ordinary bleaching-solution has been employed. Another important application of chlorine gas and of bleaching-powder is to the destruction of disease germs. Acid vapors, sulphurous acid in particular, under the form of the fumes of burning sulphur, are often employed for that purpose; but chlorine is superior to any other agent, and is now widely employed for the purposes of fumigation and disinfection.

In medicine, chlorine gas dissolved in water is used extensively for bactericidal purposes. It is employed as a mouth-wash and for bathing

CHLORIS — CHLOROPHYLL

purposes, being both a deodorant and a bactericide; and internally has been used for its germicidal properties, particularly in typhoid fever.

Chloris, klō'ris. (1) The Greek goddess of flowers and the wife of Zephyrus, identical with the Flora of the Romans. (2) The daughter of the Orchomenian Amphion, the wife of Neleus and the mother of Nestor. (3) The daughter of the Theban Amphion and of Niobe. When the children of Niobe was killed she alone escaped along with Amyclas, and became so pale from terror that her former name of Melibœa was exchanged for that of Chloris.

Chlo'ris, or **Prairie Chloris** (*Chloris verticillata*), a genus of grasses, of which there are some 60 or more species, mostly natives of warm, dry countries. About 10 of these species are found on the prairies, from Kansas to Texas. *Chloris radiata* is a pretty annual grass frequently cultivated in greenhouses for the sake of its ornamental and curious appearance.

Chlo'rite Group, in mineralogy, a group of minerals crystallizing in the monoclinic system, exhibiting a green color from the presence of ferrous iron, and chemically definable as hydrous silicates of aluminum, ferrous iron and magnesium. They are usually secondary minerals, derived from pyroxene, amphibole, and other forms. They exhibit a marked basal cleavage suggestive of mica; but they differ from mica and its allies by not containing any considerable amounts of calcium or of the alkalis.

Chlorite Schist, shist. As chlorite is a general name for green secondary hydrated silicates, containing alumina and iron, derived particularly from augite, hornblende, and biotite, so chlorite is used as a prefix to various names of rocks that contain such silicates, for example, chlorite schist. In the wide belt of Algonkian and Archæan rocks stretching from Labrador to the west end of Lake Superior are great areas of chlorite schists resulting from the alteration of sedimentary as well as igneous rocks.

Chlorodyne, klō'rō-din or -dēn, a proprietary mixture of uncertain composition, and best represented by the National Formulary formula, which is a mixture of chloroform, cannabis indica, morphine, and tincture of capsicum. Practically all of the chlorodynes on the market contain morphine, and hence are dangerous poisons. Their sale should not be permitted save on a physician's prescription.

Chloroform (CHCl₃, trichloromethane, methenyl chloride, terchloride of formyl), a heavy, clear, colorless, mobile, and diffusible liquid of a sweet burning taste and characteristic ethereal odor formed by the action of the sun's rays on a mixture of chlorine and marsh gas; also by the action of caustic potash on chloral or chloracetic acid, or by the action of nascent hydrogen on tetrachloride of carbon. It is prepared on a large scale by distilling water and alcohol with bleaching powder. Its vapor density is four times that of air. Its specific gravity should not be below 1.49, and it should be soluble in 200 volumes of cold water, and in all proportions in alcohol, ether, benzol, benzine, and fixed and volatile oils. It is volatile, even at low temperatures, boils at 140° F. and freezes at -94° F. It should not be exposed to the light, as it is liable to decomposition with the liberation of hydrochloric acid and chlorine.

As used in medicine it is a liquid consisting of 99 to 99.4 per cent by weight of absolute chloroform and 1 to 0.6 per cent of alcohol. It is not inflammable, but its vapor burns with a greenish flame. It is an excellent solvent for a variety of substances, as caoutchouc, resins, fats, alkaloids, etc. Medicinally it is used as an aqua, emulsion, liniment, spiritus, and pure U. S. P. chloroform. Its physiological action is allied to the alcohols, but it is much more energetic. Externally chloroform is an irritant, and if confined on the skin it can cause blistering. It is irritant to mucous membranes, and, taken into the stomach, causes a sense of warmth and burning with increased production of gastric secretions. In large doses it causes violent gastro-enteritis.

Its chief use in medicine is as a general anæsthetic, for which purpose it was first used by Simpson, of Edinburgh, in 1848. As an anæsthetic its vapor is inhaled; it thus enters the circulation through the blood circulating in the lungs. When so administered the stages of anæsthesia closely resemble those induced by others of the alcohol series, but in chloroform the anæsthesia is very rapid. There is first a stage of excitement, with heightened cerebral activities. This is soon followed by a gradual dissolution of the mental faculties, usually in an order the reverse of their complexity. Thus the highest faculties of judgment, memory, etc., are attacked first, then unconsciousness gradually sets in. The spinal cord centres are then affected; there may be some temporary irritation, which is followed by paralysis, and then by loss of sensation and of the reflexes. The automatic centres of breathing and the heart-beat are only slightly affected. There may be some lessening of heart action, following an initial stimulation, and similar respiratory changes. The patient thus in complete anæsthesia is motionless and senseless, unable to feel or move, his automatic functions of most vital importance to life-maintenance alone functioning. It is in this stage that operations are performed, although minor operations may be performed in the early stages of primary anæsthesia.

When the administration of chloroform is pushed too far, or there is a peculiar susceptibility to its effects, as in some individuals, poisoning results. It is usually rapid in onset, is attended with cyanosis, weak, trembling pulse, and reduction of blood pressure. The vasomotor system seems to be paralyzed, and death is due perhaps to this alone, although other factors seem to be involved at times. Following chloroform anæsthesia, nausea and vomiting are apt to occur. Chloroform is a safe anæsthetic, deaths to the proportion of 1:3,000 or 1:4,000 are said to occur; hence ether, which has a proportion of 1:16,000 is preferred by many. This is so particularly in America, whereas in Europe chloroform is preferred. See ANÆSTHETICS; ETHER.

Chlo'rophane, in mineralogy, a variety of fluorspar, or fluorite, which, when heated, shines with a green phosphorescent light. It is found at Trumbull, Conn., and in the mica mines of Amelia County, Va.

Chlorophyll, klō'rō-fil, the green coloring matter of plants. It plays an important part in the life of the plant, as it breaks up the carbonic

JOSEPH HODGES CHOATE.

acid gas taken in by the stomata of the leaves into its two elements, carbon and oxygen, returning the oxygen to the air, and converting the carbon with the water obtained from the roots into starch. Light is indispensable to the formation of chlorophyll, and hence arises the etiolation or blanching of plants by privation of light, either by the art of the gardener or from accidental causes.

Chlorophyllite, klō-rō-fil'it, an alteration product of the mineral iolite (q.v.). The only difference in composition is a larger percentage of water, but there is a marked decrease in hardness, from 7 to from 1.5 to 3, and also in transparency. The characteristic blue color of iolite is changed to a dull green, while a basal cleavage is highly developed. Its specific gravity is 2.7. It is found at Unity, Me.

Chloro'sis, an anæmia occurring in young girls about the period of puberty and characterized by a low percentage of hemoglobin in the blood. It is common in blondes, and in ill-fed and house-confined individuals. The chief symptoms are sickly greenish pallor, hence the name green-sickness, marked debility, breathlessness, palpitation, and tendency to fainting. There is frequently mental depression, irritability, and often perversion of the appetite. The most characteristic changes are in the blood. Here the number of red cells may be normal or slightly diminished, but the percentage of hemoglobin is reduced one half or even more. There is no marked leucocytosis. Gastro-intestinal symptoms may be present. Constipation is the rule. There may be anæmic heart murmurs; the pulse is soft and full; and in many cases there is a low persistent fever. Headaches, neuralgias, and cold hands and feet are prevalent. The treatment is by means of open air, exercise, iron, arsenic, full diet, and pleasant occupation.

Chlorosis is also one of the most formidable diseases to which plants are liable, often admitting of no remedy. It consists in a pallid condition of the plant, in which the tissues are weak and unable to contend against severe changes, and the cells are more or less destitute of chlorophyll. It is distinct from blanching, because it may exist in plants exposed to direct light on a south border, but is often produced or aggravated by cold, ungenial weather and bad drainage. The most promising remedy is watering them with a very weak solution of sulphate of iron. Many forms of the disease exist, of which those of clover, onions, cucumbers, and melons are best known.

Chmelnizkij, Nikolaj Ivanovich, nē'ko-li ē-van'ō vich hmēl-nīt'skē, Russian writer: b. 1789; d. 1846. He contributed largely to the reformation and elevation of the Russian stage. Among his comedies are: 'The Babbler'; 'Air Castles'; 'The Waverer.'

Chmielnicki, hmē-ēl-nīt'skē, **Bogdan**, Cossack chief: b. 1593; d. 25 Aug. 1657. He was the son of a Polish nobleman, who settled among the Cossacks of the Ukraine. This people, who had long defended the eastern boundaries of Poland against the Tartars and Russians, were at that time subjected to grievous oppression. Their religion was persecuted, their freedom circumscribed, and the castle of Kudak, called the curb of the Cossacks, was built to

restrain them. Thus exasperated, they seized Kudak and massacred the garrison, but were soon subdued. After their defeat at Kumejki, Bogdan was sent to the Polish court, where he was favorably received, but suspicion soon drove him forth, and finally made him a scourge of Poland. Availing himself of the hatred and prejudices of the Cossacks, he entered upon a conspiracy against the Poles, and sought the alliance of the khan of the Tartars. Chmielnicki became master of the Ukraine, and carried terror, devastation, and death as far as Lemberg and Zamosc. Under the new king, John Casimir, the war was continued with equal cruelty on both sides. Chmielnicki put himself under the protection of Turkey, of Russia (1654), and again under that of Poland (1656).

Choate, Joseph Hodges, American lawyer and diplomat: b. Salem, Mass., 24 Jan. 1832. He was graduated at Harvard University in 1852, and at the Harvard Law School two years later. After practicing law in Boston for a year he went to New York city, where he achieved remarkable success as a lawyer, becoming in 1884 a member of the famous legal firm of Evarts, Choate and Beaman. He won great distinction as a trial lawyer conducting many celebrated cases in State and Federal Courts and International tribunals. He successfully defended General Fitz John Porter, prosecuted the infamous Tweed Ring, appeared in the Tilden Will contest, the Chinese Exclusion cases, the Income Tax cases of 1894, and represented the Canadian government in the Bering Sea dispute. In 1856, he became active as a republican in supporting John C. Fremont. In 1894 he was president of the New York State Constitutional Convention. In 1896 he was a candidate for United States Senator but was defeated by T. C. Platt. President McKinley appointed him in 1899 to succeed John Hay as ambassador to the Court of Saint James. Mr. Choate is famous as an orator and shares with Chauncey M. Depew, the title of leading humorous after-dinner speaker of this country. Consult Clemens, 'Choate Story Book' (1900).

Choate, Rufus, American lawyer: b. Essex, Mass., 1 Oct. 1799; d. Halifax, N. S., 13 July 1858. He was graduated at Dartmouth College in 1819; was admitted to the bar and began practice in Danvers in 1823; removed to Salem in 1828; and was a member of Congress in 1830-4, resigning in the latter year. Removing to Boston in 1834, he rapidly acquired a large practice. He was successor of Daniel Webster in the United States Senate in 1841-5; resuming his legal practice in Boston at the expiration of his senatorial term. He traveled in Europe in 1850, and was a delegate to the Whig National Convention in Baltimore in 1852. After Webster's death Mr. Choate was acknowledged the leader of the Massachusetts bar. He made many political speeches, the most brilliant, while a United States senator, including those on the Oregon Boundary, the Tariff, the Fiscal Bank Bill, the Smithsonian Institution, and the Annexation of Texas. His style is peculiar and characteristic, but hardly to be commended as a model for imitation; it is rich, vivid and glowing, instinct with passion, and colored with all the hues of fancy, but sometimes, it must be admitted, a little extravagant and exaggerated. The most remarkable qual-

CHOCKS—CHOCTAW

ity, however, in his written compositions, is the structure of his periods. These are not the short and compact statements, involving but a single proposition, in which most writers of our times express their thoughts; but they recall and renew the continuous sweep and long-resounding march of the prose writers of the 16th century. They are often of breathless length, containing clause after clause, modifying, enlarging, or limiting the leading idea. His 'Addresses and Orations' appeared in a sixth edition in 1891. See Brown, 'Life of Rufus Choate' (1870); Neilson, 'Memories of Rufus Choate' (1884); Whipple, 'Recollections of Eminent Men' (1886).

Chocks, pieces of wood employed on ship-board as wedges to support various articles liable to be displaced by the motion of the vessel. They receive different names according to the purposes for which they are used, as "anchor-chocks" to support the anchor; "rudder-chocks" to keep the rudder immovable, in the event of accident rendering it unmanageable. Chocks are also used to support casks, boats, and other curved objects.

Choc'olate (Mex. *chocolatl*, from *choco*, cocoa, and *latl*, water), a cake or paste prepared from the seeds of *Theobroma cacao*, made by mixing the seeds with water and grinding them very finely. When this is done by machinery, the mill is usually constructed of heavy metal rollers turning in a circular course upon a flat metal plate. A curved knife or scoop attached to the rollers returns the paste continually to be crushed and recrushed by the rollers until it becomes almost impalpable. The object of this is to render the nut, otherwise difficult of solution, readily diffusible in water or milk when used as a beverage. The paste, when unmixed, or mixed only with flour or other farinaceous material, is usually called cocoa, but when much sugar or spices such as vanilla, cinnamon, etc., are added, it bears the name of chocolate. The two names are much confounded commercially. Chocolate is molded into cakes, or sold in powder or flakes formed by simply drying the paste as it comes from the mill. The seeds or nuts contain a large proportion (30 to 50 per cent) of oily matter (cocoa butter). This may be partially removed or all retained in the chocolate. In the latter case much of it is mechanically adherent to the sugar or farinaceous matter. Chocolate was introduced from America to Europe by the Spaniards. It is highly nutritious, containing a large proportion of nitrogenous flesh-forming material. On this account it is used as portable food by many mountaineers. In the solid form, mixed with much sugar, cream, and various confections, it is largely used as a sweetmeat, and in pastry.

Choc'taw (properly *Cha'hta*, the chief "Chactas" in Chateaubriand's 'Atala' is an eponym of the tribe), one of the largest tribes of the great Muskogean (q.v.) stock, and before its deportation the most advanced in husbandry and general culture of any except the Creeks. They were called "Flatheads" by the French (not to be confused with the northwestern tribe of that name), from a habit of flattening their children's skulls with bags of sand; and they had a burial custom of disinterring the corpses after a few days, cleaning the bones, and preserving them. They are rather short,

stout, and slow, compared to the taller and more active Chickasaw (q.v.); and were nicknamed "tubbies," though not on that ground, but from the customary final word of their war-chiefs' names, meaning "killer." The Chickasaw was one of their subdivisions, or perhaps merely the more warlike and adventurous portion, till after the whole had crossed the Mississippi; and while using a dialectic language of their own for common service, still employed Choctaw for oratory. The Choctaw occupied central and southern Mississippi and western Alabama in three divisions, west of the Muskogee; and in the 18th century their chief towns lay in two groups, one some 200 miles north of New Orleans (about the present Choctaw County, Miss.), and the other about half way from the Chickasaw to Mobile. These villages a century earlier had been numerous and widely distributed; they are stated at 40, and the tribe as having 2,500 warriors. It was first found by De Soto in his expedition of 1540. At their town of Mavila (Mobile, probably Choctaw Bluff, Clarke County, Ala., on the north bank of the Alabama), was fought perhaps the bloodiest and most destructive single battle ever known between red and white men on the continent. The village was burned, 20 of De Soto's men killed and 150 wounded, and many hundreds of Indians slain—the Spanish chroniclers say 2,500 to 3,000, which may be discounted. Tristan de Luna met them again in 1560. The French, in settling this region about 1700, came immediately in contact with them, and established friendly relations with them, contrasting strongly with the permanent hostility of the Chickasaw, against whom and the Natchez the Choctaw aided the French. The latter planted forts in their country, and sent missionaries among them. In the final struggle between France and England, however, the English won over a part of them, including the chief Red Shoes. After the Revolution, the Choctaw shared with the other Indians in the general treaty of Hopewell 28 Nov. 1785, by which the sovereignty of the United States was recognized, a portion of the Choctaw lands ceded, and they were "guaranteed" the possession of the rest. By 1800 some 500 of them had migrated to the Arkansas (Indian Territory), and it is said that the rest were much less unwilling to go than the Cherokees and Creeks. They did good service to the Americans in the Creek war 1813-14. In 1820, by the treaty of Doak's Stand, they ceded part of their lands for an equivalent amount on the Arkansas; and in 1830, by that of Dancing Rabbit Creek, they gave up the rest—19,000,000 acres, or nearly 30,000 square miles, in the two cessions, for 20,000,000 acres in Indian Territory and \$2,225,000 in money and goods. In 1837 they removed with the Chickasaw to their new lands, between the Arkansas and Canadian rivers on the north and the Red River on the south. How the Chickasaw first amalgamated with and then separated from them is told under CHICKASAW. They made good progress, received the missionaries of the American board and several Church denominations, were given a well-diffused school system, and established a government consisting of a head chief, a council of 40 chiefs, a two-chambered legislature, and a regular judiciary system with trial by jury. Like all the southern tribes, they were slaveholders, and in 1860 had some 5,000 negro

slaves. Their superintendent and agents were Southerners, and they joined the Confederate side in the Civil War. Though their land was not overrun, their progress was brought to a standstill, and their population reduced by a third; and after the War, they were for a time deprived of their rights. On being restored, they had to part with a section of their lands to the government, which settled other tribes there. For a time, a territorial government was formed, with the superintendent as governor; and they had to make heavy allowances to their emancipated slaves. In 1900 there were 10,321 Choctaws proper in the Territory, besides those who had taken up lands in severalty; and some hundreds still remaining in Mississippi. A grammar of their difficult language was published in 1870.

Choczim, *hō'tsīm* (properly *Khotin*), Russia, a fortified town, on the right bank of the Dniester, opposite to Kamnec, in Bessarabia. In 1718 the Turks caused it to be regularly fortified by French engineers; but it was taken by the Russians in 1730, 1769, and 1788. As it is completely commanded by the hills which surround it, its value as a fortress is now small. Its chief importance is as a military station. Pop. 16,000.

Chodat, *shō-dā*, **R.**, Swiss botanist: b. Moutier-Grandval, Jura-bernois, 6 April 1865. In 1889 he became a professor of botany in Geneva University and has been *doyen* of the Faculté des Sciences there, from 1898. He has contributed numerous professional papers to botanical journals, and has published many important monographs.

Chodkiewicz, *hōd-kē-ā'vich*, **Jan Karol**, Polish general: b. Lithuania 1500; d. Chocim 27 Sept. 1621. He served against the Cossacks, defeated Charles IX. of Sweden in 1605, and afterward served against the Russians and the Turks.

Chodowiecki, *hō-dō-vē-čts'kē*, **Daniel Nicolaus**, German designer and engraver: b. Dantzic 16 Oct. 1726; d. Berlin 7 Feb. 1801. He was instructed in miniature painting by his father, and subsequently painted snuff boxes. He was encouraged to study enameling, and soon attracted attention by the beauty and finish of his productions, some of which came under the notice of the academy of Berlin, and procured him a commission to make a set of designs for their almanac. The manner in which he executed these established his reputation. He thenceforth devoted himself almost exclusively to designing and engraving; he produced the plates for Klopstock's 'Messiah,' 'Don Quixote,' Lavater's 'Physiognomy,' editions of Shakespeare, Voltaire, La Fontaine, and many other works.

Chodzko, *kōdz'kō*, **Jacob Leonard**, Polish scholar: b. Oborek 6 Nov. 1800; d. 1871. Having traveled as secretary of Prince Oginski through nearly all Europe, he established himself in 1826 at Paris, where he published a memoir of the prince, with an introduction entitled 'Observations sur la Pologne et les Polonais' (Paris 1827), and commenced collecting materials for a history of his country from the death of Augustus III. Afterward he published the 'History of the Polish Legions in Italy, Under the Command of Gen. Dombrowski' (1829). During the revolution of July

1830, Lafayette appointed him his aide-de-camp; and after the outbreak of 29 November of the same year in Warsaw, he acted as agent of the revolutionary government in France. He was an active member of the French-Polish and American-Polish committees, and after the failure of the revolution, as member of the national Polish committee of France.

Chœnix, *kē'nīks*, a measure of capacity among the ancient Greeks. Its size is variously given, and it is probable that it actually differed in the different states of Greece. Some accounts represent it as containing three cotylæ, or about 1.487 pints English; others make it equal to 1.982 pints; and still others give it as equal to 3.964 pints.

Chœrilus, *kē'ri-lūs*, the name of several Greek poets, among whom Chœrilus of Samos is the best known. He lived in the 5th century B.C., was the contemporary and friend of Herodotus, and composed an epic poem, entitled *Persica*, celebrating the victory of the Greeks over Xerxes. The fragments of the poem still extant have been collected and explained by Nike (Leipsic 1817). Another Chœrilus, of Iasus, in Caria, is mentioned by Horace, but does not appear to have possessed much poetical talent. He formed part of the train of literary men who accompanied Alexander the Great on his expedition to the East.

Choir. 1. In religious worship, an organized body of singers. In ceremonial Christian religions, and more particularly in the ordering of services in the Church of England, the minor canons, vicars choral, and choristers, or other singers taken collectively, are spoken of as the choir. The choral body in the latter Church is usually divided into two sets of voices, the one sitting on the north and the other on the south side of the chancel, and are known by the respective titles of Cantoris and Decani from their nearness to the Cantor (or Precentor) and to the Decanus (or Dean). In most cathedrals and collegiate chapels, the Decani side is held to be the side of honor, the best voices are placed there, and all the verses or soli parts, if not otherwise directed, are sung by that side, which is also considered the "first choir" (*coro primo*) in eighth-part music. 2. In architecture, the eastern limb of a cruciform church or the eastern portion of any church. In the latter case it is more commonly styled the chancel (q.v.), and is frequently constructionally lower and narrower than the main part of the building. The ordinary daily services in a cathedral or collegiate church are held in the choir. While architecturally the term choir is applied to the entire portion of the church east of the crossing, the eastern limb is itself divided into three portions: (1) the "ritual choir," containing the stalls for the singers and comprising the western portion of the architectural choir; (2) the presbytery, next east of this, containing seats for the laity (a term sometimes applied to all of the choir east of the "ritual choir"); (3) the sanctuary, containing the altar and sedilia, and divided from the remainder by a low railing. In certain cases there is even a fourth division called the retro-choir, comprising one or more bays east of the sanctuary. These are sometimes, as at Lincoln, Truro, and York, of the same roof elevation as the rest of the choir, but more commonly parts of a lower

CHOIR INVISIBLE—CHOKE-CHERRY

structure, as at Hereford, Winchester, and Salisbury. It should be noted that the "ritual choir," or place for the singers, does not invariably correspond with the architectural choir. Sometimes, as Winchester, Norwich, and Gloucester cathedrals, it includes the crossing and one or more bays of the nave, or again, as at Westminster Abbey, and in Spanish cathedrals generally, it is entirely in the nave, from the remaining portion of which it is separated by a massive wall or screen. In buildings where the ritual choir is entirely east of the crossing, the choir screen is placed between the eastern piers of the crossing. At Gloucester, Exeter, Lincoln, York, Southwell, and several other cathedrals, the organ is placed upon the choir screen. In several English cathedrals the choir is quite as long as the nave, and in some parish churches even longer, but the usual proportion of choir to nave is as one to three. In French churches the choir frequently terminates polygonally with encircling chapels and this termination is known as a chevet, but in England the square east end is the most common in Gothic churches, although in Norman ones the semi-circular apse is not infrequent. In the Middle Ages, the choir, as the most indispensable portion of the church, was erected first, the nave, regarded practically as a stately approach to the choir, was built later, a century or more sometimes intervening between the completion of the choir and that of the nave. At the present time the cathedral of Saint John the Divine in New York is being erected after the mediæval custom, the intention being to wait for some years after the completion of the choir before beginning work upon the nave.

Choir Invisible, The, a novel by James Lane Allen, published in 1897. It is one of his most popular and pleasing stories, and was enlarged from an earlier story called 'John Gray.' Its scene is the Kentucky of 100 years ago, and the fresh picturesque descriptions of pioneer life in Kentucky give the tale historical value.

Choiseul-Amboise, Étienne François, *ait'-en fran swa shwa-zel-an-bwaz*, Duc DE, French statesman: b. 28 June 1710; d. Paris 7 May 1785. He entered the army in early life, and after distinguishing himself on various occasions in the Austrian War of Succession, returned to Paris, where his marriage with the daughter of the financier, Crozat, gave him the command of great wealth, and his intimacy with Madame de Pompadour furnished the means of gratifying his ambition. After having been ambassador at Rome, where he obtained from the Pope, Benedict XIV., the celebrated encyclical letter intended to appease the disputes which had arisen on the bull *Unigenitus*, and at Vienna, where he concluded with Maria Theresa the treaty of alliance against Prussia, he became in 1758 minister of foreign affairs. At the same time he was made a duke. He succeeded the marshal of Belle-Isle as minister of war in 1761, and the same year he became also minister of marine. His administration was distinguished by many useful reforms. He reorganized the army and navy, which the disasters of previous wars and the neglect of previous administrations had suffered to fall into decay; negotiated the famous Family Compact which reunited the various members of the Bourbon family, and restored Corsica to France.

His fall was brought about in 1770 by a court intrigue, supported by Madame du Barry, the new favorite of the king. He was recalled to court on the accession of Louis XVI. in 1774, but not again intrusted with power.

Choiseul-Gouffier, goo-fê-ä, Marie Gabriel Florent Auguste de, COUNT OF, French antiquarian: b. Paris 27 Sept. 1752; d. Aix-la-Chapelle 20 June 1817. He early displayed a particular interest in everything relating to Greece. His wish to visit this country was gratified in 1776, and in 1782 appeared the first volume of '*Voyage Pittoresque en Grèce*,' which attracted much attention and procured him a seat in the French Academy in 1784. The two other volumes appeared in 1809 and 1820. The first was entirely revised by him before his death. The same year he was appointed ambassador to Constantinople, where he remained till 1791. The appointment of ambassador to London was then offered to him, but he remained at Constantinople and sent his official correspondence to the exiled French princes. This correspondence having fallen into the hands of the republicans the convention gave orders for his arrest, but he escaped by taking refuge in St. Petersburg, where Paul I. made him a privy-councillor, director of the Academy of Arts, and superintendent of the imperial libraries. He returned to France in 1802 and resumed his seat in the Academy. In 1814 he was made a peer of the realm. His antiquarian researches were chiefly inserted in the memoirs of the National Institute, and his very valuable collection of antiquities is now in the museum of the Louvre.

Choiseul-Praslin, prä-län, Eugène Antoine (*è zhân an twan*) **Horace de**, French statesman: b. 23 Feb. 1837. He was first elected to the National Assembly in 1871, and has been several times a member of the chamber of deputies. He is considered one of the leaders of the Republicans. In 1871 he was minister plenipotentiary to Italy; in 1880 he became secretary of state in the ministry of foreign affairs; and in 1887 was sent on a botanical expedition to Ceylon and the United States.

Choisy-le-Roi, shwä-zê-lè-rwä, or Choisy-sur-Seine, France, a town in the department of Seine, seven miles south of Paris, on the left bank of the Seine. Its broad, straight streets, elegant houses, and fine avenues, with the proximity of the Seine, contribute to render it one of the most agreeable towns in the vicinity of Paris. In its cemetery is the tomb of Rouget de l'Isle, author of the '*Marseillaise*.' It has manufactures of wax cloth, soap, chemical stuffs, glass, morocco leather, earthen-ware, porcelain, and vinegar, and some trade in wine, vinegar, coal, etc. Pop. 11,281.

Choke-cherry (*Prunus virginia*), so called from the astringent nature of the fruit, a shrub from 2 to 10 feet high, rarely a small tree, belonging to the natural order *Drupacea*. For commercial uses the wild black cherry (*Prunus serotina*), which is closely allied to *P. virginiana*, is valuable. Its wood is one of the best American woods for cabinet-making. The bark has medicinal properties as a pectoral tonic, and febrifuge. The range of choke-cherry is wide, flourishing along river banks and in rocky situations, from Canada to Florida, and west to Colorado and Texas.

CHOKE-DAMP — CHOLERA

Choke-damp, the name given by miners to the fire-damp resulting from an explosion of gas in mines. The following diagram is illustrative of the combustion of fire-damp, or carburetted hydrogen, of which the product is choke-damp, called also after-damp and black-damp:

Before Combustion. W'ght.	Elementary Mixture. Atoms.	Products of Combustion W'ght. W'ght.
8 carburetted hydrogen...	1 carbon 1 hydrogen 1 hydrogen	6 22 carbonic acid. 9 steam. 9 steam.
144 atmosph'ic air.....	1 oxygen 1 oxygen 1 oxygen 8 nitrogen	8 8 8 112 uncombin'd nit
152	152	152 choke-damp.

Choking, a stoppage caused by a morsel of food, a drop of liquid, etc., passing into the larynx or upper opening of the windpipe, instead of the gullet, or an obstruction of the œsophagus itself. It is usually followed by a violent fit of coughing which lasts, in slight cases, till the offending substance is expelled. Sometimes, however, a larger mass—for example, a half-chewed piece of meat—is drawn into the opening of the windpipe, completely blocking it, and arresting respiration altogether. This condition is one of extreme danger; the sufferer becomes purple in the face, and if not at once relieved will certainly and quickly die of suffocation. The obstructing substance is usually within reach, and may often be dislodged if a by-stander promptly pushes his forefinger to the back of the throat and attempts to draw the obstruction forward. A child may sometimes be saved by holding it up by the heels and shaking it, or slapping its back. If these measures fail relief may be obtained by means of a sharp-pointed knife promptly pushed into the windpipe to admit air to it below the obstruction. In the case of an animal, remove the obstruction with the hand when possible. Cause the animal to swallow the obstructing substance, if possible, by giving it water, oil or belladonna solution. Carefully push the obstruction down by a probang, if it is possible to effect this, and if withdrawal by the mouth is impracticable. In some cases the gullet has to be cut into by a surgeon.

Cholagogue, kö'l'a-gög, a remedy that increases the flow of bile, as distinguished from an hepatic stimulant, which increases the production of bile. Most of the cathartics that stimulate peristalsis affect the gall bladder, causing it to empty itself more energetically. These may be classed in general as cholagogues. See CATHARTICS.

Cholera, kö'l'èr-a, an acute, infectious disease, endemic in some localities and epidemic in others, characterized by vomiting and purging of a peculiar rice-water-like fluid, and a stage of collapse.

Etiology.—The prime cause of cholera is one of the most perplexing questions with which scientists have had to deal, and even at this advanced period of scientific investigation it is not definitely known. The claim that it is caused by a germ is not accepted by all. Disease germs, which, according to their form, are known as cocci, bacteria, bacilli, vibrios, and

spirilla, are among the smallest units of life; 30,000,000 of them, according to Prof. Max von Pettenkofer, of Munich, weighing only one milligram. In 1884 Dr. Koch claimed that the comma-shaped bacillus was the true cause of the disease, and this theory seems to have met with considerable favor, though it is not yet admitted as a scientific truth. In fact Dr. Koch himself, in an address delivered before the Imperial German Board of Health at Berlin, 30 Aug. 1884, admits that the true cause of cholera is not precisely known, though he invariably found it to exist. Dr. H. Vandyke Carter of London says that the real cholera germ, if such a thing truly exists, has yet to be found. He, too, says he found an organism resembling a vibrio rather than a bacillus, and this he did not find in all cases. He also claims that it would be irrational to suppose that an everywhere widely distributed organism like *Vibrio frugula* can alone be the essential cause of Asiatic cholera. His investigations were all in India, and he did not see an authentic specimen of this organism. Others assert that it is a specific disease originating in India, and the assertion is also made that cholera can arise spontaneously in other countries and is not dependent on a specific cause.

Dr. Koch says that the comma bacilli grow extremely rapidly and reach a maximum in two days; after that they commence to die, and other bacteria form in their place. Temperature has very little to do with their lives, however. They are said to live at temperatures ranging from -15° to 104° F. These bacilli are located solely in the intestines, as, according to Dr. Koch, none have been found to exist in the blood or in any of the other organs. In the lower section of the lower intestines they are found in greatest abundance, also in the dejecta, but not often in the vomit. It is said that the bacilli cannot live in the stomach, and the reason that most deaths occur on Monday and Tuesday is because those days succeed the one in which over-eating and -drinking is usually indulged in, and the bacillus is conveyed into the intestines by the undigested mass of food that passes into them.

How Bacteria Kill.—The question then arises, How is it that this bacterial vegetation in the intestines can kill a man? Bacteria not only consume substances, but also produce others of various kinds, many of which are of a very peculiar nature. Some are of a transient nature and emit an intense smell; others produce coloring matter or some poisonous substance. In the putrefaction of albuminous liquids blood poisons are formed which must be products of vital changes of these bacteria, as putrefaction is only a consequence of bacterial vegetation.

It is asserted that these comma bacilli destroy the blood corpuscles within a pretty wide range, and it is fair to conclude that they also destroy more or less of the surrounding tissues. Mr. Richards, a physician at Goalundo, in India, says that sometimes one can feed the dejecta to animals and do no harm; at other times the dejecta prove fatal and the animals die in cramps. The time required for such animals to die after eating the dejecta is from 15 minutes to two and a half hours.

This reasoning does not go to show that these animals die from a species of bacteria, but

CHOLERA INFANTUM—CHOLET

from a poison of some peculiar nature generated from the cholera dejecta, and why this action does not occur in all cases is more than can be explained, unless it is influenced by the contents of the stomach. Some pathologists claim that death is produced by paralysis; others say by mortification of the epithelium and mucous membrane; and again it is said to be due to inspissation of the blood, produced by loss of water. It would seem, however, that death is caused, in many cases at least, by irritation of the nerve centres, and consequently by some peculiar brain lesion.

Dr. Koch concludes that the only way known at present to get rid of the infectious matter of cholera is to dry it, and thus kill the germ. A more important matter, granting the comma bacillus to be the true cause of cholera, would seem to be to learn how to dispose of it in the human stomach before it goes farther and terminates life, which it must surely do when it enters the intestine.

Cholera originated in the East Indies and was not known to migrate for 1,000 years. The oldest Sanskrit writings show that it was known many hundred years before the birth of Christ. In the 17th and 18th centuries there are abundant proofs of epidemics, but it did not spread into Europe until 1830. The Russians took it from India through couriers and stage-coaches. Another peculiarity of this disease is that when it was in Marseilles it broke out in Paris, jumping Lyons, the second largest town in France, notwithstanding the fact that quarantines were in full force.

A Miasmatic Disease.—The cholera germ, like the malaria bacillus, depends greatly upon a moist soil, and if it does not depend upon this, and is not a miasmatic disease, how can it be explained that in India, the home of cholera, it seldom, if ever, occurs on the mountain-tops, proving conclusively that it at least often occurs as a miasmatic disease and may be wholly independent of human intercourse. It must be remembered that in India the inhabitants drink the same water that they wash in, and, as a rule, are exceedingly careless, so it is easy to believe that cleanliness has a great influence in preventing the disease.

'The Lancet' of 15 Jan. 1885 says that a special commission was sent out from England to India to inquire into the cause of cholera, with particular reference to the theory of Prof. Koch that the comma bacillus is the true seed of the disease. The commissioners were Dr. E. Klein and Dr. Heneage Gibbs, both medical men of distinction and accomplished in physiological research. The result of their labors in the very home of cholera is tersely stated by Dr. J. N. Cunningham, the Sanitary Commissioner of the government of British India, when he says that their conclusions "are altogether subversive of the statements advanced by Prof. Koch as to the so-called comma bacillus being the cause of cholera."

Pathological Anatomy of Cholera.—After death the stomach contains more or less of the whey-like albuminous fluid and is full of cast-off epithelium. The small intestines usually contain a large quantity of the whey-like fluid and epithelium. The glands of Brunner, the solitary and agminated patches, are thickened and very prominent. The solitary glands of the large intestines are also infiltrated and swollen.

The liver is more or less advanced in fatty degeneration. The kidneys have a pale, white appearance, due to the epithelium blocking the tubes. The bladder is empty and contracted. The lungs are congested. The right cavities of the heart are distended with blood, while the left cavities are empty and contracted.

Cholera is usually ushered in by vomiting, purging, and griping pains in the stomach, and death follows in from 1 to 24 hours. If life is retained longer than this time the patient may possibly recover. A large percentage of the cases die.

Treatment.—Opium, quinine, whiskey, sulphuric acid, camphor, chloroform, chlorodyne, carbolic acid, bismuth, hydrocyanic acid, chloral, and atropia are the favorite remedies. Brown Sequard says the most efficient remedy is the hypodermic injection of morphia with atropia. He, too, says this treatment will prevent an attack of cholera.

H. H. BIEDLER, M.D.

Dean, Baltimore University School of Medicine.

Cholera Infantum, an acute infectious disease of infants, due in large part to a definite micro-organism, the *Bacillus shiga*, or allied species, characterized by acute gastro-enteric inflammation, with nausea, vomiting, diarrhœa, temperature, wasting, and prostration. Death may result in a very short time. The child may be attacked suddenly, but it is more liable to occur in children who have been somewhat run down from a mild diarrhœa of indigestion. The child is then taken with the cholera-like diarrhœa, passing thin serous- or rice-water discharges, 10 to 20 a day. The temperature rises abruptly to from 103° to 105° F. and there is constant vomiting. There is rapid emaciation and prostration, the child having strength only to moan or cry with a sharp irritable sound. Dullness, stupor, and at times convulsions precede death. Treatment should be prompt and requires skilled medical attendance. Acute summer diarrhœa of infants is not necessarily cholera infantum. In fact cholera infantum is not a common disease, whereas the acute diarrhœas of children, resulting from tainted foodstuffs, is very common. Every case of summer diarrhœa, however, should receive vigorous treatment, because it offers an opportunity for the *Bacillus shiga* to develop cholera infantum.

Cholesterin, kō les'tēr-in ($C_{27}H_{46}O$), a substance found in bile, blood, etc., which may be obtained in the form of beautiful pearly crystalline scales, without taste or odor. It is widely distributed in the animal economy, being essential to the brain and nerve substance, and having been found in milk and many portions of the body, both as a normal and as a pathological constituent. Cholesterin was first obtained by Conradi, in 1755, from human gall-stones, in which it is often present in large quantities. It melts at 297° F. It is the chief constituent of lanolin (q.v.), a highly important oily substance that is obtained from the grease of sheep's wool.

Cholet, shō-lā, France, a town in the department of Maine-et-Loire, on the right bank of the Moine, 32 miles southwest of Angers. It has a tribunal of commerce, consulting chamber of manufactures, and communal college. Its manufactures include handkerchiefs and cotton goods, called *cholettes*, flannels, and woolen

stuffs. There are also wool and cotton spinning-mills, bleachfields, dyeworks, and tanneries. There is also a great trade in cattle, the markets for which are attended by a large concourse of buyers from other parts. Pop. 15,000.

Choliambus, kō-lī-ām'būs (Greek, *choliambos*, the lame iambus; also called *skazon*, from *skazo*, to halt; or *versus Hipponacticus*, because the satirist Hipponax of Ephesus made use of it, or perhaps invented it), an iambic trimeter, the last foot of which, instead of being an iambus, is a trochee or spondee, which gives it a lame motion, as, for instance, Martial, l. i. epig. 3:

Cur in theatrum, Cato severe, venisti?
An ideo tantum veneras, ut exires?

We perceive, from the construction of the choliambus, that it may be applied with advantage to produce a comic effect. The Germans have happily imitated this verse, as well as all other ancient metres. An instance of a German choliambus is—

~~~~~  
Der Choliambe scheint ein Vers für Kunstrichter.

**Cholic** (kōl'ik) **Acid** ( $C_{21}H_{34}O_8$ ), a non-nitrogenous acid produced by decomposing the true biliary acids with an alkali. It does not exist in bile ready formed. It is crystalline, sparingly soluble in water, but readily soluble in alcohol and ether. The cholates are rather obscurely crystalline; they are not very soluble in water, but rather more so in spirit. Both the acid and salts have a bitter taste.

**Choline**, kōl'in, a basic body found in both plants and animals. In animals it is apparently one of the reduction compounds of proteids, being a trimethyl oxyethyl ammonium hydroxide. It is of interest in medicine chiefly because of its close affinities to two very poisonous compounds, into either of which it may be converted. By oxidation it builds neurine, a highly poisonous body; and by hydration it becomes an alkaloid-like body closely resembling the plant alkaloid muscarine, from the poisonous mushroom *Amanita muscaria*. Thus choline may be one of the auto-intoxicating substances that may be developed in the human body if its normal metabolism is disturbed. It may also be a factor in the so-called ptomaine poisoning.

**Cholmondeley**, chūm'lī, **Mary**, English novelist. Her fictions have been extremely popular and include 'The Danvers Jewels'; 'Sir Charles Danvers'; 'Diana Tempest'; 'A De-votee'; 'Red Pottage'; 'Love In Extremis.'

**Cholochrome**, kōl'ō-krōm, or **Cholophæin**, the brown coloring matter contained in bile and in the intestines, and the substance coloring the feces and the skin in jaundice.

**Cholophæin**, kōl'ō-fē'in. See **CHOLOCHROME**.

**Cholos**, shō'lōz, in Peru, the name for those who are partly of white, partly of Indian parentage, the most numerous class of the community.

**Cholula**, chō-loo'lā, Mexico, a city in the state of Puebla. It is 12 miles west of La Puebla, 60 miles southeast of the city of Mexico. The streets are regular and spacious, the houses mostly of one story, and flat-roofed. Though fallen from the importance it had attained in the early part of the 16th century,

it still exhibits traces of its former greatness. Under the name of Chumultecol it was once the capital of an independent district, and the seat of the religion of the ancient Mexicans. It was the great centre of the Aztec worship. At that time it contained, it is said, 40,000 houses and more than 400 temples; one of these temples still remains, though in ruins. It is described by Humboldt as being built in the form of a pyramid, of four stories of equal height, in alternate layers of clay and sun-burned bricks; each side of its base measuring 1,440 feet, and its height in all 164 feet. At the present day it is so altered that it looks at a distance like a natural hill. On one of its highest platforms a chapel has been constructed, in the form of a cross, 90 feet long, with two towers and a cupola. Since the introduction of Christianity, this and other of its temples have been used for Christian worship. Pop. 10,000.

**Chondrine**, kōn'drīn, a substance containing carbon, hydrogen, nitrogen, oxygen, and sulphur, obtained from rib-cartilage by continuous boiling with water, exhausting with ether to remove fat, and drying. Its composition varies slightly according to the material made use of; it contains about 0.4 per cent of sulphur. It is a diaphanous horny mass, insoluble in alcohol, but softening and dissolving in hot water. From this solution it is thrown down as a bulky precipitate by acids, and by the salts of several heavy metals. By boiling with sulphuric acid it is decomposed into leucine, and with hydrochloric acid into a sugar-like body called chondroglycose. Nothing definite is known about its origin or function in the body. It has a marked general resemblance to gelatine, but it is distinguished by giving the precipitates just mentioned with the acids and salts. Infusion of nut-galls precipitates both.

**Chondro'ma**. See **TUMORS**.

**Chon'dro-sarco'ma**. See **TUMORS**.

**Chondropterygii**, kōn-drōp-tēr-jj'ē-i. Under this name were included by Cuvier the sturgeons, sharks, rays, lampreys, mud-fish, and lancelet, an assemblage of fishes so unnatural that the possession of fins and gills sums up nearly all they have in common. The term was adopted to give prominence to what seemed a fact of cardinal importance, namely, that the skeleton of the limbs was cartilaginous. In modern systems the *Amphioxus*, or lancelet, is the sole example of an order—*Leptocardii* (Muller) or *Pharyngobranchii* (Huxley)—in which the cranium is purely membranous and scarcely larger than the spinal canal; the spinal marrow is enclosed in a sheath, with only traces of division into vertebræ; and a heart is wanting, the circulation being maintained by the contractility of the blood-vessels. The glutinous hag (*Myxine*), the river lamprey (*Petromyzon*) and its larva (*Ammocetes branchialis*), represent the order *Cyclostomata*, known also as *Marsipobranchii*, the gills being lodged in pouches. These two groups should, in the opinion of some, form two distinct classes of equal value with the remainder of the fishes, which are divided into the ganoids, or *Ganoidei*; the osseous fishes, or *Teleostei*; the *Selachii*, including the sharks and rays; and the *Dipnoi*, represented by the mud-fish (*Lepidosiren*). The last-named group comes under the *Chondrop-*

## CHONDROSTEI — CHOPUNNISH

*terygii* of Cuvier, but it is now known to rank very high in the scale among fishes, and to be closely related to the amphibians or to the reptiles, inasmuch as its heart has two auricles, the other fishes having only one, and true lungs co-exist with gills. Again, while the skeleton of the sturgeon is nearly wholly cartilaginous, that of the other ganoids is well ossified, while the structure of the heart and sense organs removes the *Selachii* very far from the lancelet and the cyclostomatous fishes. The cartilaginous or embryonic condition of the skeleton may persist through life among the fishes in association with the highest as well as the lowest development in other respects. The Cuvierian group is therefore now distributed according to the sum of the characters, and the fishes included in it are not massed together simply because one point of structure is common to all.

**Chondrostei**, kōn-drōs'tē-i, an order of bony fishes of lowly and degenerate organization, formerly classed as cartilaginous ganoids. The internal skeleton is but little ossified, the vertebrae and most of the skull remaining in a state of pure cartilage; but the skull is enclosed by close-fitting dermal bony plates, which are peculiar in having a median in addition to paired series. The notochord is largely persistent. The mouth is small, and ventral in position; and the jaws very weak and toothless, or provided with minute teeth. In the gill-cover the opercular bones are reduced in number, and the branchiostegal rays absent or wanting. There are no true scales, but a small number of longitudinal rows of large bony plates, with granules on the intervening skin. The intestine is provided, as in the sharks, with a spiral valve. The elongated snout, stout body, large fins, and strongly heterocercal tail complete the aspect of these survivors of a once dominant race. There are two families, the *Acipenseridae*, or sturgeons (q.v.), and the *Polyodontidae*, or paddle-fishes (q.v.).

**Chondrus**, kōn'drūs, the genus of seaweeds to which carrageen or Irish moss belongs.

**Chonos** (chō'nōs) **Archipelago**, or **Guaytecás Islands**, a group of islands belonging to the Chilean province of Chiloe, lying off the west coast of Patagonia, mostly between lats. 44° and 46° S., and lon. 74° and 75° W. Two are large, but they are all barren and scantily inhabited. Magdalena is the largest island.

**Chop-sticks** (Chinese, *kwai-tsz*, "nimble or diligent lads"), two smooth sticks, about the thickness of a quill, of bamboo, wood, or ivory, which are used by the Chinese for conveying meat or vegetables, particularly rice, to the mouth. The chop-sticks are used in various manners, serving partially the purposes of a fork and a spoon. The most curious mode of using the chop-sticks is when a bowl of rice is brought close to the lips, the mouth held wide open, and the grain dexterously dashed into it with the chop-sticks, held one on each side of the forefinger, and plied with a rapid motion quite suggestive of the Chinese title.

**Chopin**, **Frédéric François**, frā'dē rīk frāñ swā shō-pāñ, Polish musical composer and pianist: b. Zelazowa-Wola, near Warsaw, 1 March 1809; d. Paris 17 Oct. 1849. His father was a Frenchman and his mother a Pole. After studying music in Warsaw he traveled through

various cities of Germany and Austria, and finally settled in Paris in 1831. Here he became celebrated as a virtuoso and composer, and made the acquaintance of Liszt, George Sand, Berlioz, and other well-known persons. In 1837 and in 1848, he visited England, and in the latter year he also played in Edinburgh and Glasgow. He wrote numerous pieces for the pianoforte, of which he was called the poet, but he seldom composed for the orchestra. His music is largely based on various Slavonic rhythms. His mazurkas first introduced this style of music into France. His works include 19 nocturnes, 52 mazurkas, 27 études, 3 sonatas, 25 preludes, 13 waltzes, 12 polonaises, 5 rondos, 4 scherzos, 4 ballades, 4 fantasias, a funeral march, several songs, etc. He united bold innovations with a classical style. See Karasowski, 'Frédéric Chopin,' English translation (1879); Liszt, 'Life of Chopin,' English translation (1877); Finck, 'Chopin and Other Musical Essays' (1889); Niecks, 'Chopin as Man and Musician' (1889); 'Life,' by Villeby (1892); Hunneker, 'Chopin: the Man and His Music' (1900).

**Chopin**, shō-pāñ, **Kate O'Flaherty**, American writer: b. St. Louis, Mo., 8 Feb. 1851; married Oscar Chopin, a New Orleans cotton factor, in 1870. Since his death she has lived in her native city. She has published 'At Fault' (1891); 'Bayou Folk' (1894); 'A Night in Acadie' (1897); 'The Awakening' (1899).

**Chopin**, chōp'in, a Scotch liquid measure containing two imperial pints. The chopin, in name at least, was derived from the French, with whom a similar measure was in use till the introduction of the metric system. The French *chopine* was not a uniform measure, but varied according to localities. That of Paris was a little over four fifths of an imperial pint.

**Chopine**, chō-pēn', an elevated shoe or clog, introduced into England from Venice in the reign of Queen Elizabeth, and which became the fashionable wear of court ladies during that reign. The Venetian chopines were made of wood covered with leather of sundry colors, white, red, yellow, and sometimes gilt. Some were of great height, the height of the chopine being regarded as a mark of the rank of the wearer. To such a degree of extravagance was this carried that women of rank could not walk without being supported. This silly fashion does not seem to have been carried to the same excess in England. Hamlet (act ii, scene 2) addresses one of the players, "Your ladyship is nearer to heaven than when I saw you last by the altitude of a chopine."

**Chop'tank River** rises in Kent County, Del., flows southwest into Maryland, and near the south extremity of Talbot County spreads into an estuary several miles wide and nearly 20 miles long, through which it empties into Chesapeake Bay; total course, 100 miles. It is navigable for sloops to the mouth of Tuckahoe River, a distance of about 50 miles.

**Chopunnish**, chō-pūn'ish, or **Nez Percé**, a tribe of North American Indians, also known as Nimapu, or Sahaptin, the principal tribe of the Sahaptian confederation, who now live on the Nez Percé reservation, in Idaho, and number 1,515. The name Nez Percé originated from the custom formerly followed of piercing the

## CHORAGIC MONUMENT — CHORAL SOCIETIES

nose. In the Nez Percé war the tribe was under the control of Chief Joseph, who forbade his men to interfere with any white non-combatants. See SAHAPTIAN INDIANS.

**Choragic** (kō-rāj'ik) **Monument**, in ancient Greece, a monument erected in honor of one who had gained a prize as "choragus," or organizer of the play and chorus. The remains of two very fine monuments of this sort are still to be seen at Athens, namely, those of Thrasyllus and of Lysicrates, the last popularly called the Lantern of Demosthenes.

**Choragus**, kō-rā'gūs, or **Choregus**, among the ancient Greeks, the musician who directed each of the choruses furnished by the 10 Attic tribes for the public festivals; also the citizens who defrayed the expense of each chorus. The person of the choragus was inviolable, as well as those of the members of the chorus. The choragus who was adjudged to have performed his duty best received an ornamental tripod, engraved by a skilful artist, and bearing the name of the tribe which had gained the victory, of the citizen who had paid the expense, and of the master who had trained the choir. These tripods were set up as public monuments on pillars or other structures. A street in Athens which contained a great number of such monuments was called the Street of the Tripods. The most remarkable of these monuments yet remaining is the choragic monument of Lysicrates. See CHORAGIC MONUMENT; CHORUS.

**Cho'ral Service**, a service with intoned responses, and the use of music throughout wherever it is authorized. The service is said to be partly choral when only canticles, hymns, etc., are sung; wholly choral, when, in addition to these, the versicles, responses, etc., are sung.

**Choral Societies.** A choral society is a body of amateur singers formed for the purpose of studying and performing large choral works. Formerly all chorus singers were professional musicians, and the chorus that took part in the production of an oratorio did not usually number over 40, while the orchestra was frequently larger than this.

To-day all choral societies consist of amateurs and are much larger than their professional predecessors, while the orchestra is only slightly increased in size. An average chorus numbers 150 to 200 voices, while the orchestra varies from 35 to 60 men. It is possible that the magnificent effect of the chorus formed to celebrate the centenary of Handel's birth by performances given in Westminster Abbey and the Pantheon in London in 1784 may have been a great factor in the formation of choral societies in England. This chorus was the largest that had ever been formed up to that time. It numbered 274 and the orchestra 251. At a subsequent festival in 1791 the chorus and orchestra were said to have numbered over 1,000, while for the Handel Festival held in the Crystal Palace in London in 1874 the chorus numbered 3,200 and the orchestra over 500.

It is very doubtful, however, whether such a large body of singers and players is very materially more effective than a smaller one. The impression on first hearing an enormous chorus is nearly always one of disappointment at the volume of sound. The explanation is made that the large hall necessary for such a large chorus and audience causes a loss of quantity of tone,

but this is disproved by comparisons made at a Saengerfest held in Philadelphia, Pa. Here the effect of the entire mass chorus of 5,000 male voices was not much greater than that of a single society of 250 voices. There was a difference, of course, but the volume was not 20 times greater, not even twice as great.

A well-balanced chorus of from 200 to 500 voices is now generally acknowledged to be more effective and much easier to command than the overgrown chorus gotten together for a festival. Choruses of this size are very numerous in the United States, Germany, and England, where choral work, both religious and secular, is highly appreciated and supported; it is remarkable that France and Italy, both musical countries and more devoted to vocal than to instrumental music, do not cultivate choral music more generally. Even Berlioz in writing out his list of an ideal musical force to have at command makes his orchestra almost equal in numbers with his chorus, showing that he had a professional chorus in mind, and that therefore in his time (died 1869) a choral society of amateurs was perhaps unknown.

The Berlin Singakademie, still in existence and world renowned, was the first permanent choral society. Founded in 1791 with 27 members it now numbers 600. Mendelssohn was at one time its conductor.

In the United States the first choral society was the Stoughton (Mass.) Musical Society (1786), the outgrowth of a "sacred singing school" founded in 1724. The Handel and Haydn of Boston (1815) was of much greater importance, however, and is to-day one of the most important choral societies in the New World. Until 1847 the president of the society was its conductor, but with the increase of musical ability and criticism it was felt that the time-honored custom would have to be given up. Under Bergman (1852) and Zerrahn (1854) it increased in numbers and ability. Within the last few years under Mollenhauer (1901) a thorough reorganization took place and the society has recovered the position which it had to some extent lost.

The Cecilia Society, founded in 1900, under the direction of B. J. Lang, has done good work in the field of choral music.

In New York a number of choral societies, the Handel and Haydn, the New York Choral Society and the New York Sacred Music Society, dating from 1819 to 1849, fostered the taste for choral music. After this for more than 20 years no long-continued effort was made to carry on the work, until in 1873 Dr. Leopold Damrosch founded the Oratorio Society which, beginning with about 50 members, now numbers nearly 300. Walter Damrosch, son of Dr. Leopold Damrosch, succeeded him as conductor, and Frank Damrosch, another son, is the present conductor. The latter is also conductor of the Musical Art Society, devoted to the performance of older church music, and the People's Choral Union of 2,000 voices drawn from the laboring classes.

Philadelphia has had several notable choral societies, the Handel and Haydn, the Beethoven, the Cecilian and the Philadelphia Chorus, conducted by Henry G. Thunder, Michael H. Cross, Chas. M. Schmitz, and W. W. Gilchrist. These have all passed away, but in their stead is a new and vigorous chorus of 300 voices, founded in

## CHORALE — CHOREA

1897 and conducted by Henry Gordon Thunder, son of Henry G. Thunder.

In Baltimore the Oratorio Society under Pache, and in Washington the Choral Society under Kaspar, are presenting standard works in an adequate manner.

In Chicago the Apollo Club (1872) under Harrison M. Wild, and in St. Louis the Choral Symphony Society (1870) under Ernst, are bending public taste toward the great choral works.

While the giving of music festivals involves the forming of a large chorus in conjunction with orchestra and soloists, it does not appear that such bodies of voices are appropriately styled choral societies in the strict sense; hence only passing mention is here made of the Springfield, Worcester, and Cincinnati festivals, all of which have large and efficient choruses conducted by Chadwick, Goodrich, and Theodore Thomas.

A difference, however, must be made between these choruses and the Bach Choir of Bethlehem, Pa. This unique organization of about 100 voices under the direction of J. Fred Wille has devoted itself to the presentation of the works of John Sebastian Bach, and in the three festivals held in 1900, 1901, and 1903 has achieved a national reputation for itself. It produced the great Mass in B minor for the first time in America, besides giving the Matthew Passion, the Christmas Oratorio and other works in a most impressive manner. To some extent this was no doubt due to the unusual and reverential surroundings, the old Moravian town, the venerable church in which the performances were held, the announcement of the performance by a choir of trombones in the belfry. All these details no doubt helped greatly to create an atmosphere of simplicity and sincerity that affected the audiences that gathered from far and wide, but the real effect was the chorus work, which was done with an earnestness and devotion that were most impressive and caused the often inadequate solo and orchestra work to be forgotten.

HENRY GORDON THUNDER.  
*Conductor Philadelphia Chorus.*

**Cho'rale**, a musical term borrowed from the German. It signifies a simple melody set in parts to be sung in harmony by a number of voices to sacred words, usually in public worship: a psalm tune. In Germany the chorale is frequently sung in unison. This was the ancient practice, adopted before the laws of harmony were well understood.

**Chorazin**, *kō-rā'zīn*, Palestine, one of the cities in which Christ's mighty works were done, but named only in his denunciation (Matt. xi. 21; Luke x. 13). It was known to St. Jerome, who describes it as on the shore of the lake, two miles from Capernaum. Robinson locates it at the modern Tell-hūn, three miles northeast of Capernaum, but this location is doubtful.

**Chord**, (from the Greek word *chordē*, a string of gut). 1. In music, the simultaneous and harmonious union of different sounds, at first intuitively recognized by the ear, and afterward reduced to a science by the invention of the laws or rules of harmony. Chords may consist of from two to five parts. Absolute chords of two parts are produced only by thirds or sevenths. Chords of more than two parts are either fundamental chords or inversions of

them, and are divided into concords and discords. The union of sounds in all chords will be found, on analyzing their component parts, to be an admixture of major and minor thirds. The common chord of *Trias harmonica perfecta*, is the basis of all harmony, and consists of a base note, or prime, with its third and fifth above. These three sounds are the distance of a third from each other. When the lowest third is the greater third, as above, the chord is a major chord; but when the lowest third is the lesser, the chord is called a minor chord. A chord of two minor thirds combined is called diminished, as the interval from the lowest note to the highest is less than a perfect fifth, the common chord admits of two inversions, according as one or other of its notes is made the base, or lowest note of the chord.

By adding another third above the common chord, a chord of four parts is produced, which is called the chord of the seventh, because the highest note is a seventh above the bass. When the chord of the seventh is produced on the fifth of the scale it is then called the dominant seventh, which is the most perfect species of the chord. It then consists of a major third, perfect fifth, and seventh, the minor, which is the next harmonic produced by nature above the fifth. The chord of the seventh may be formed also on any of the notes of the major or minor scale taken as a bass note, which produces the varieties of major, minor, and diminished seventh. The chord of the seventh admits of three inversions, according as the notes above the fundamental note are used as bass notes. From its nature, it requires a resolution, and is therefore always followed by a common chord, whose fundamental bass is a fifth below that of the seventh.

2. In geometry, a chord is the straight line which joins the two extremities of the arc of a curve; so called from the resemblance which the arc and chord together have to a bow and its string, the chord representing the string. The chord of a circular arc is obtained by multiplying the radius by twice the sine of half the angle which the arc subtends at the centre.

**Chordata**, *kōr-dā'ta*, the most advanced in development of the phyla, or branches, of the animal kingdom, the phylum which is characterized by the presence of a notochord (q.v.), and in its higher classes by the presence of a backbone and spinal cord. It includes all the vertebrates (mammals, birds, amphibians, reptiles, and fishes), and also *Amphioxus*, the ascidians, and *Balanoglossus* (q.v.). Compare ADELOCHORDA.

**Chorea**, or **St. Vitus' Dance**, an acute convulsive disorder of childhood, characterized by sudden onset, irregular convulsive, non-rhythmical movements of the limbs or of the body and by a recovery usually spontaneous. There are many diverse conditions that have been called chorea in the past. There are strong reasons to believe that true chorea, however, is due to the action of some micro-organism; and, in view of the close relation it bears to rheumatic invasions in the same individual, the inference has been drawn by many serious students that chorea is a toxic disorder due probably to the same organism that causes acute articular rheumatism (Poynton & Payne). It occurs most frequently in the spring months,

in children from 5 to 15 years of age, and a nervous temperament seems necessary. The symptoms may be very slight, consisting of a grimace, or a sudden movement of the arms, causing the patient to drop anything held in the hands at the time. Or it may involve a large part of the musculature, especially the muscles of the extremities. It is non-symmetrical, the movements are sudden and jerky and non-purposeful, not representing any usual co-ordinated muscular act; hence the difficulty there is in imitating the movements. The attacks may begin in a few muscles, remain there, or spread widely. There may be slight or grave constitutional disturbances; some patients even die, although death is not a usual result in this country. In England, where rheumatic disorders seem to be more common, the disease seems to be more prevalent and more severe. The usual course of the disease is from four weeks to three months, but it may persist longer and even become chronic, although the chronic cases are probable forms of spasmodic tics. Treatment is very satisfactory. Rest, open air, nutritious diet, and some form of arsenic, are the general lines of treatment. Medical assistance is imperative, however, in view of the possible existence of heart lesions and other grave accompaniments of this affection. For hereditary chorea see HUNTINGDON'S DISEASE.

**Chorion**, kō'ri-on, the outermost of the membranes that surround the embryo. It is a most important structure in its developmental history as it comes into close contact with the decidua and is incorporated into the placenta, constituting the fetal part.

**Chorley**, chōr'li, **Henry Fothergill**, English critic and miscellaneous writer: b. Blackley Hurst, Lancashire, 15 Dec. 1808; d. London 15 Feb. 1872. His criticisms appeared mostly in the 'Athenæum' of London, displaying fine perception and exquisite taste in matters connected with literature and music. His novels, however ('Conti'; 'The Prodigy'; and 'The Lion'), are failures from the popular point of view, although finely written; and his plays, with the exception of 'Old Love and New Fortune,' are weak.

**Chorley**, a municipal borough and market town of England, in Lancashire, on the Chor, 20 miles northwest of Manchester. It consists of spacious well-built streets, and contains an ancient parish church, various other churches and chapels of modern date, together with a spacious town-hall, several large schools, club-houses, theatres, etc. The principal manufacture is that of cotton goods, but there are also bleaching, calico-printing, and dye-wood works, floor-cloth works, and iron foundries. In the vicinity are coal, lead, and iron mines, and millstone quarries. Pop. (1901) 26,850.

**Choron**, **Alexandre Étienne**, ä-lëks-ändr ä-të-ën shō-rôn, French musician: b. Caen 21 Oct. 1772; d. Paris 29 June 1834. He labored assiduously to promote musical education in France, founding his famous "Conservatory" in 1818. He wrote 'Principes de Composition des écoles d'Italie' (1808), and other valuable textbooks on music.

**Cho'rus**, originally a special feature in the Greek drama. During the most flourishing period of Attic tragedy the chorus was a troop of male performers, wearing masks, and repre-

senting male or female characters, who, during the whole representation, were spectators of the action. In the intervals of the action the chorus chanted songs, which related to the subject of the performance, and were intended either to augment the impression or to express the feeling of the audience on the course of the action. Sometimes it even took a direct part in the action by observations on the conduct of the dramatic characters, by advice, consolation, exhortation, or dissuasion. It usually represented a part, generally the oldest portion of the people, where the action happened, sometimes the counselors of the king, etc. The chorus was an indispensable part of the representation. In the beginning it consisted of a great number of persons, sometimes as many as 50; but the number of the tragic chorus was afterward limited to 15; while the chorus in comedy numbered 24. The exhibition of a chorus was in Athens an honorable civil charge, and was called choragy. (See CHORAGUS.) The leader or chief of a chorus was called coryphæus, who spoke in the name of the rest when the chorus participated in the action. The chorus was often divided into two parts, who sung alternately. The divisions of the chorus were not stationary, but moved from one side of the stage to the other; from which circumstance the names of the portions of verse which they recited, *strophe*, *anti-strophe*, and *epode*, are derived. But it cannot be determined in what manner the chorus sung. It is probable that it was in a sort of solemn recitative, and that their melodies, if we may call them so, consisted in unisons and octaves, and were very simple. They were accompanied by flutes. With the decline of ancient tragedy the chorus was omitted. Some modern tragedians, as Racine in France and Schiller in Germany, have attempted, with more or less success, to imitate or revive the Greek chorus. Shakespeare has employed devices founded on it.

Chorus, in modern music, is that part of a composite vocal performance which is executed by the whole body of the singers, in contradistinction to the solo airs and concerted pieces for selected voices. The singers themselves are also called the chorus.

**Chose**, shōz, a thing, a chattel, a piece of property; the subject-matter of an action. Chose is used in divers senses, of which the four following are the most important: Chose local, a thing annexed to a place, as a mill; chose transitory, that which is movable, and may be taken away or carried from place to place; chose in action, otherwise called chose in suspense, a thing of which a man has not the possession or actual enjoyment, but has a right to demand by action or other proceeding; chose in possession, a thing which a person has not only the right to enjoy, but also its actual enjoyment.

**Chosroes** (kōs'rō-ëz) I., King of Persia: d. 579. He succeeded to the throne in 531, and his memory is still venerated in the East, where his virtues obtained him the titles of the Magnanimous and the Just. At his accession Persia was involved in a war with Justinian, which Chosroes terminated successfully, obliging Justinian to purchase peace by the payment of a large sum of money. In 540, however, jealous of the victories of Belisarius, the great general

## CHOSROES II.—CHOWCHOW

of the empire, Chosroes violated the peace, invaded Syria, laid Antioch in ashes, and returned home laden with spoils. The war continued till 562, when the emperor again purchased peace by an annual tribute of 30,000 pieces of gold. The peace continued for 10 years, when the war was renewed with Justin, the successor of Justinian, when Chosroes was again successful. His zeal for the administration of justice sometimes led him to acts of cruelty; but he encouraged the arts, founded academies, and made a considerable proficiency in philosophy himself. His reputation obtained him a visit from seven sages of Greece, who still adhered to the Pagan religion; and in a treaty with Justinian he required that they should be exempt from the penalties enacted against those who continued to favor Paganism. It was in the reign of Chosroes that the Turks first became known to Europeans, first as friends, afterward as enemies, of the Persian king.

**Chosroes II.**, king of Persia, grandson of the preceding. He ascended the throne in 591, on the deposition of his father. He was assisted by the Emperor Mauricius, and on the assassination of the latter by Phocas (602) he took up arms against the empire, and refused to make peace at the solicitation of Heraclius, the succeeding emperor. By a long series of successes he raised the Persian power to the highest point, and reduced the empire to extremity. Heraclius, however, taking courage from despair, succeeded in a series of brilliant campaigns in recovering his lost provinces, 622-7. Chosroes, repeatedly defeated, was completely overthrown in the great battle of Nineveh. He fled with his favorite wife Sirā, but after witnessing the massacre of his numerous sons he was thrown into a dungeon and assassinated by command of his son Siroes.

**Chota Nagpur**, or **Chota Nagpore**, *chō tā nāg-poor*, British India, a division of Bengal, a commissionership which is divided into the districts of Lohardaga, Hazaribagh, Singhbhum, Palamau, and Manbhum; area 26,966 square miles. It consists for the most part of an undulating plateau about 3,000 feet above the sea, and rising occasionally into ridges of hills which stretch from east to west. The drainage is received chiefly by numerous tributaries of the Subarna-rekha in the northeast, and by the north and south Coel and other streams in the south and west. Much of the surface is over-run with jungle, or covered with forests containing teak and other kinds of valuable timber. The soil in the plains consists of a red loam, and where under cultivation, produces excellent crops of wheat, barley, rice, pulse, cotton, and sugarcane. Coal occurs in various localities, and is worked in the Karharbari coal-fields in Hazaribagh. The trade, hampered by imperfect means of conveyance, is limited, and is nearly confined to grain, lac, coarse silk, oil-seeds, and other agricultural products. Pop. (1891) 4,628,792.

**Chouans**, *shoo-ān*, a name given to the royalist peasantry of Brittany and lower Maine, who carried on a petty warfare against the republican government from an early period of the French Revolution. The name Chouan was finally extended to all the Vendéans. The name was derived from the first chief of the Chouans, Jean Cottereau, who with his three

brothers organized these bands in 1792, under the inspiration of the Marquis de la Rouarie, an ardent leader of the Royalists. Cottereau was the son and grandson of persons engaged in the manufacture of wooden shoes. He had joined a band of dealers in contraband salt, and acquired the surname Chouan from the cry of the screech-owl (*chat-huant*), which he used as a signal with his companions. He was killed in an engagement with the Republican troops, 28 July 1794. After the death of Jean Cottereau, the Chouans became quite lawless, engaging in guerrilla warfare and highway robbery. About 1800 they ceased to rob and terrorize, and, although, in 1815 an effort was made to revive the insurrection, they were suppressed by Gen. La Marque.

**Chouans, The**, a romance by Balzac, the novelist's first important work. The title, when it appeared in 1829, was 'The Last Chouan; or, Bretagne in 1800.' In 1846 it was rearranged in its present form. The author made a profound study of the scenery of Bretagne, and the manners of its people, before he wrote his romance; and his pictures of both scenery and people have the stamp of reality and truth.

**Chough**, *chūf*, a bird (*Fregilus graculus*), belonging to the sub-order *Fregulina* of the crow family, and particularly the Cornish chough. The name is derived from the cawing of the bird. It is widely distributed over Europe, India, and northern Africa, living in great colonies in the faces of precipitous cliffs. The bill is long and slightly curved; feathers black; the claws long and hooked, enabling it to cling to the slight projections of rocks and stone walls. It is often tamed and kept as a household pet, but is now disappearing, giving place to the jackdaw.

**Chousinga**, *chow'sin-gā*, a gazelle-like Indian antelope, remarkable for the fact that the buck has four horns. See **FOUR-HORNED ANTELOPE**.

**Chouteau**, *shoo-tō*, **Auguste**, American pioneer: b. New Orleans, La., 1739; d. St. Louis, Mo., 24 Feb. 1829. He was from his early youth a fur trader, and in 1763 set out with his brother Pierre Chouteau (q.v.) to establish trading stations in the regions west of the Mississippi. On this trip they founded the city of St. Louis in 1764.

**Chouteau, Pierre**, *pē-ār*, American pioneer: b. New Orleans 1749; d. St. Louis 9 July 1849. He had few early advantages, but, becoming a fur trader, decided, in 1763, to extend his operations to the region beyond the Mississippi. With his brother, Auguste, he set out in 1763, joining a government expedition. He stopped in the heart of an unsettled country and founded, with his brother, the city of St. Louis.

**Chouteau, Pierre, Jr.**, American fur trader, son of the preceding: b. St. Louis 19 Jan. 1789; d. St. Louis 8 Sept. 1865. He worked for his father and began trading in fur early in life. After establishing posts for the sale of skins throughout the trans-Mississippi region he purchased the fur-trading interests of John Jacob Astor.

**Chowchow**, a diminutive breed of Siberian sledge-dogs, improved and developed in China, whence they began to be imported into Europe and America at the beginning of the 20th cen-

ture. These dogs have the form and coat of their useful progenitors, and are very compact and sturdy of frame, and lively in disposition. The tail is carried tightly curled over the back. In color they are either all black, even to the tongue and inside of the mouth, or all white, blue, red, or yellow. This breed was not recognized in American bench-shows until 1902.

**Chow-chow**, a Chinese or pidgin English word meaning chopped up or broken and mixed. It is applied to a confection of mixed fruits made in China; to a mustard pickle of assorted ingredients made in India; and in the United States and Great Britain to a similar pickle usually compounded of chopped cabbage, green tomatoes, green or red peppers, spices, vinegar, mustard-seed, cucumbers, etc.

**Chowder** (French *chaudière*, "a kettle"), a dish of French origin, composed chiefly of vegetables, pork, and fish or shell-fish, boiled together. Perhaps the most common form of chowder is that made from clams, either from the soft-shelled variety or the hard-shelled round clam or quahog. Chowder is a favorite dish on the New England coast and among the Newfoundland fishermen. A fish chowder is made as follows: Salt pork cut into small strips or dice is cooked for a few minutes in a deep iron kettle. Sliced or chopped onions are slightly browned in the pork fat, and onions and pork are then removed. A layer of sliced potatoes is laid in the kettle, then a layer of fish (small ones entire or large fish in slices), a layer of salt pork, one of onions, and so on alternately to the requisite amount. The fried salt pork and onions are also distributed through the mass, which should be seasoned throughout with salt, pepper, thyme, and savory. A very common ingredient is ship-bread or other hard crackers laid in between the other layers. A small quantity of water or of milk, or of both, is poured into the kettle, and the whole is boiled, without stirring, until cooked through. In adding the water or milk it must be remembered that chowder is a stew,—not a soup. Foreign cooks make a soup of clams, potatoes, onions, and tomatoes, which passes under the name of clam chowder. Genuine chowder is never disturbed until it is served, and in camps is portioned out, in layers, direct from the kettle.

**Chrétien de Troyes**, krâ-tê-ên dè trwâ, French trouvère: b. Troyes about 1150; d. about the end of the 12th or beginning of the 13th century. He translated Ovid's 'Ars Amandi' into French, and probably wrote some works based on the classics, but his fame rests upon the still extant romances of Arthur and the Knights of the Round Table, the materials for which were obtained from Geoffrey of Monmouth's rather credulous 'History of Britain.' They are entitled 'Iric et Guide'; 'Perceval le Gallois'; 'Le Chevalier au Lion'; 'Cliget'; 'Chevalier de la Table Ronde'; 'Lancelot du Lac'; and 'Guillaume d'Angleterre'; but the authorship of the last named is doubtful. Other two of his works, 'Tristan, ou le Roi Marc et la Reine Yseult' and 'Le Chevalier à l'Épée,' have been apparently lost. His language and versification were models for troubadours and romancers for a long time; and from him the Arthurian poets to the end of the 13th century borrowed episodes, themes, situations, charac-

ters, and all manner of poet's devices. Chrétien was a master of invention, fashioned for himself a competent literary vehicle, and made most effective use of his large knowledge of men and manners. See Forster, 'Christian von Troyes sämtliche erhaltene Werke' (1884).

**Chriemhild**, krēm-hîlt. See KRIEMHILD.

**Chrism**, krîzm, a mixture of olive oil with balm (*opobalsamum*), which, being blessed by the bishop, is used in the Roman Catholic Church in the administration of the sacraments of baptism, confirmation, holy orders, and extreme unction, and in certain rites; as in consecrating the instruments of the divine service, as the sacred vessels, church edifices, altar stones. The chrism of the Greek Church is compounded of olive oil and a great variety of spices. In the Roman Catholic Church the holy oils are blessed by the bishop on the Thursday of Holy Week.

**Chrisom**, krîz'ôm, the name of the white linen cloth laid by the priest on the child in Roman Catholic baptism, to signify its innocence. By olden usage it was generally presented by the mother as an offering to the Church, but if the child died before the mother was churched, it was used as a shroud. By a common abuse of words, Chrisom came to mean the child itself, being first applied in the old bills of mortality to denote such children as died within the month of birth.

**Christ** (Greek *Christos*, the anointed; *Messiah*, from the Hebrew, has the same signification). See CHRISTIANITY; JESUS.

**Christ, Disciples of**, a denomination of Christians in the United States commonly known as the Christian Church, or Church of Christ, and sometimes called Campbellites. In September 1809, Thomas Campbell, a Scotch minister of the seceders' branch of the Presbyterian Church, then living in western Pennsylvania, issued a "Declaration and Address," deploring the divided state of the Church, and urging as the only remedy a complete restoration of apostolic Christianity and the rejection of all human creeds and confessions of faith. The Christian Association of Washington, Pa., was formed for the purpose of promoting the principles set forth in this declaration. Mr. Campbell's son, Alexander, just from Glasgow University, Scotland, at once gave his splendid ability and learning to this new movement. It was not the intention of the Campbells to form a distinct religious body, but to effect the proposed reforms in the churches. Their plea was so opposed that they were compelled to act independently, and the first church in the new movement was organized at Brush Run on 4 May 1811. The Disciples maintained that having accepted the Bible as their only rule of faith and practice, and the only divine basis for the union of all Christians, they were led to reject infant baptism and adopt believers' immersion only. They observe the Lord's Supper each first day of the week, and heartily and practically accept and exalt the doctrine of the divinity of Christ. Their church policy is congregational, though they frequently hold conventions in the interest of world-wide missions, but not for legislative purposes. In 1900 the denomination had 6,528 ministers, 10,528 churches, and 1,149,982 communicants, besides

## CHRIST — CHRISTEN

several universities and colleges of high rank, and a number of religious publications.

**Christ, or Criss-Cross Row.** See **HORN-BOOK.**

**Christ in Art.** The representations of the person of the Saviour which for a succession of ages have constituted one of the most important subjects of Christian art, and have occupied the highest genius, especially of Roman Catholic artists, are all evidently ideal. The attempt to represent the personal appearance of the Saviour can hardly be traced back further than the age of Constantine. The origin of Christian art, indeed, has been traced successfully to the catacombs of Rome, and is not to be considered as springing directly from Pagan art, although the great Italian masters of the Middle Ages may have derived much instruction from classical models; but the painting and sculpture of the early Christians were chiefly allegorical, representing the moral of the gospel parables, or similar symbolic representations of Christian doctrine, without regard to historical accuracy of portraiture. At a later period legends were invented of various likenesses of the Saviour having been preserved by miraculous or other remarkable means, but these stories are intrinsically weak and improbable, and are entirely destitute of external evidence. They are of such a nature as that King Abgarus of Edessa had a napkin sent him by the Saviour himself, in which he had caused his likeness to be miraculously impressed by placing his face in it. A portrait is said to have been similarly impressed on a handkerchief of St. Veronica, and St. Luke is said to have taken one himself. An apocryphal letter of Lentulus, the predecessor of Pilate, addressed to the Roman senate, contains a description of the person of Jesus. One of the earliest professed portraits of the Saviour is in the Calixtine Catacomb near Rome. He is represented with the hair parted on the forehead, and falling over the shoulders in long waving locks. In regard to this common notion it may be observed that when St. Paul wrote his first epistle to the Corinthians there were probably many Christians scattered over the world who remembered the personal appearance of the Saviour, and if this representation of it had been correct he would hardly have written to a Christian church that it was contrary to nature and a shame for a man to have long hair. The great painters of the Middle Ages, to whom we owe the ideal representation of Christ which has now become common in symbolical paintings, probably founded somewhat upon these early notions. A Christ of the 4th century with an oval face, Oriental features, parted hair, and a short straight beard, is said to have been the model of the Byzantine and Italian painters till the time of Michael Angelo and Raphael.

**Christ, Order of,** on the abolition of the Templars by Clement V., in 1312, King Dionysius of Portugal preserved the order in his dominions, but changed its title to that of The Knights of Christ, or The Order of Our Lord Jesus Christ. This arrangement was sanctioned by Pope John XXI. or XXII., in 1319. The seat of the order was transferred from Castro-Marino to Thomar in 1366. The new order ~~afterward obtained such power that King John III. was obliged to obtain an edict from Pope Hadrian VI., in 1522, by which the grand-~~

mastership of the order became vested in the kings of Portugal.

**Christ Church, College of,** a notable institution in Oxford, England. In 1526 Wolsey obtained from Clement VII. a bull for the suppression of 22 monasteries, the site of one of which he chose for a new college, to be called Cardinal College, and which he intended to endow beyond that of any other in Oxford. On the fall of Wolsey, in 1529, the establishment came into the hands of King Henry VIII. In 1532 that prince founded it under the name of King Henry VIII.'s College, and in 1546 he once more re-established the college under the name of "Christ Church Cathedral in Oxford, or the Foundation of King Henry VIII. with a dean and canons, 60 students, 40 schoolboys, clerks, choristers," etc. The foundation is now subsisting, though it has undergone considerable modifications. According to the present statutes, which came into force in 1882, the students, who are equivalent to fellows, are divided into two classes, and are in number about 30, besides honorary students. There is also a body of scholars, over 40 in number, some of whom are elected annually from Westminster School, while others are chosen by open competition for proficiency in mathematics, physical science, or history. The students are appointed in the first instance for two years, but this term may be prolonged. There are also many exhibitioners.

**Christadelphians,** a religious body that originated during the American Civil War, their founder being Dr. J. Thomas. They believe that God will raise all who love him to an endless life in this world, but that those who do not shall absolutely perish in death; that Christ is the Son of God, inheriting moral perfection from the Deity, our human nature from his mother; and that there is no personal devil. Their chief newspaper in Great Britain is *The Christadelphian*, published in Birmingham. The works of Dr. Thomas and 'Christendom Astray' by Robert Roberts contain expositions of their religious views.

**Christchurch, England,** municipal borough in Hampshire, situated at the confluence of the Avon and Stour, about one mile from the sea. It is famous for its great priory church, dating in part from the early part of the 12th century. The church is over 300 feet long and contains a magnificent altar-screen. Fusee chains for watches used to be manufactured in Christchurch. Pop. (1901) 4,204.

**Christchurch, New Zealand,** a town, capital of the province of Canterbury, and the see of the primate of New Zealand, situated on the Avon River, seven miles from the sea, and is the terminus of the Great Northern and Southern Railway. A railway tunneled through the Lyttelton Hills connects it with Lyttelton, the nearest port. It contains a number of handsome buildings, including a fine cathedral, the government offices, St. Michael's church, the supreme court, hospital, museum, town library, lunatic asylum, convent, theatre, banks, club-house, and college, and has a flourishing trade and manufactures. Pop. (1901) 57,001.

## CHRISTIAN I.—CHRISTIAN VII.

**Christian I.**, king of Denmark and Norway: b. 1426; d. Copenhagen 21 May 1481. He reigned from 1448 to 1481, and in 1479 founded the University of Denmark.

**Christian II.**, king of Denmark, Norway and Sweden: b. Nyborg, Funen, 2 July 1481; d. Kallundborg, Zealand, 25 Jan. 1559. He was grandson of Christian I. In 1501 he was named successor to the crown, and took part in the government of Norway, which he conducted with great severity.

On his accession to the throne in 1513 he signed a capitulation in favor of the privileges of the lay and clerical aristocracy in his dominions, including the independent administration of justice; but all his efforts were bent toward strengthening the royal power, particularly in Sweden, which refused to acknowledge him. To strengthen himself against Steen Sture, the administrator of Sweden, who had set himself in opposition to the union of Calmar formed in 1397 between Norway, Sweden, and Denmark, he married Isabella, sister of Charles V of Germany, in 1515. He had already a mistress called Dyveke, the daughter of a Dutch woman who kept an inn in Bergen, Norway. She exercised a great influence over the king, and by her liberal spirit and knowledge of the institutions of Holland tended greatly to improve the administration of his government. She became a sort of prime minister, and had great influence in originating those wise laws which gained for this king the love of his subjects. But she incurred the hatred of the nobility, and in 1517 died of poison.

Soon after war broke out with Sweden, and making all the preparations and alliances in his power, Christian sent an army into Sweden commanded by Otto Krumpen, who defeated the Swedes in the decisive battle of Bogesund (Ulrikehamn), 19 Jan. 1520, in which Steen Sture, the administrator, was killed. Stockholm, under the command of the widow of Sture, stood a siege of four months, and on 4 November, Christian was crowned king of Sweden.

Subsequently Sweden revolted under Gustavus Vasa, who had expelled the Danish garrisons and been proclaimed administrator. To find the means of defense Christian convoked the Diet toward the close of 1522. Instead of attending it the nobles and prelates assembled at Wiborg in Jutland, proclaimed the deposition of Christian, and called his uncle, Frederick, to the throne. Christian fled to the Netherlands to claim the succor of his brother-in-law, Charles V. Gustavus, already master of Sweden, put an end to the union of Calmar in 1523, and was proclaimed king. Christian remained nine years in exile without obtaining aid from Charles, and then visited England and Germany, and adopted the Reformed faith. At length, with the assistance of Charles, he equipped a fleet in Holland, landed in Norway in 1531, and was proclaimed king by the Norwegian Diet, which had refused to recognize Frederick. The commander of the Danish fleet, a bishop, having offered him a safe conduct, he repaired to Copenhagen to negotiate with Frederick, who disavowed the admiral, and retained him prisoner. He was confined for 12 years in the Castle of Sonderburg, island of Alsens, in a dungeon of which the door was walled up, the only

access being by the window, and his only attendant a Norwegian dwarf. In 1544 Christian III. somewhat relaxed the rigor of his confinement, and in 1549, on renouncing his right to the crown, he was permitted to reside in the Castle of Kallundborg in Zealand, where he was subjected to a less severe surveillance, until his death in 1559. His misfortunes were chiefly due to the enmity excited by his reforms, and his violation of the capitulation entered into at his coronation. See Behrmann, 'Kong Christiern II., Historie' (1815).

**Christian III.**, king of Denmark and Norway: b. 1502; d. Kolding, Denmark, 1 Jan. 1559. He succeeded his father, Frederick I., and introduced the Reformed faith into Norway and Denmark. In his reign Norway was reduced to the status of a province.

**Christian IV.**, king of Denmark: b. Frederiksborg, Zealand, 12 April 1577; d. Copenhagen 28 Feb. 1648. He was the son of Frederick II. and succeeded to the throne as a minor in 1588. He early gave numerous proofs of a sincere love of religion and justice, and a high esteem for science and art. He made his celebrated voyage to the North Cape to learn the boundaries of his kingdom and protect the rights of his subjects in that remote region from any foreign interference with their coasting trade. He was afterward, in consequence of the claims advanced by Sweden to Lapland, engaged in what is called the Calmar war with Charles IX. and his successor, Adolphus, and terminated it by an advantageous peace, in which he stipulated for the free navigation of the Baltic. In the Thirty Years' war he was beaten by Tilly at Lutteram-Barenberge in 1626, but afterward, in conjunction with Gustavus Adolphus, obtained the Treaty of Lubeck 1629. He has the merit of having laid the foundation of the Danish navy, extended the trade of his subjects to the East Indies, introduced a judicious system of finance, and fitted out several expeditions for the discovery of a northwest passage. He was succeeded by his son, Frederick III.

**Christian V.**, king of Denmark and Norway: b. 15 April 1604; d. Copenhagen 25 Aug. 1699. He succeeded his father, Frederick III., in 1670, and carried on a long and fruitless war against Sweden.

**Christian VI.**, king of Denmark and Norway: b. 30 Nov. 1699; d. 6 Aug. 1746. He succeeded his father, Frederick IV., in 1730.

**Christian VII.**, king of Denmark and Norway: b. Copenhagen 29 Jan. 1749; d. Rendsburg, Holstein, 13 March 1808. He was the son of Frederick V., whom he succeeded in 1766. In the same year he married Caroline Matilda, sister of the British monarch, George III. He afterward traveled for three years in England, Germany, Holland, and France, and became a member of several learned academies. Youthful indulgences, however, had weakened his intellect, and obliged him to confide the charge of public business to his ministers, and more especially, it is said, to his favorite physician, Struensee, who, though he had gained the affections of Christian and his young bride, was very unpopular as a statesman, and made innovations which provoked the hostility both of the nobility and the army. Notwithstanding the unfortunate circumstances of Christian's reign,

## CHRISTIAN VIII.—CHRISTIAN CHURCH

several important improvements took place under it. Serfdom was abolished in the duchies, trade and commerce promoted, the Schleswig-Holstein Canal constructed, and excellent roads formed throughout the kingdom. Christian was succeeded by his son, Frederick VI.

**Christian VIII.**, king of Denmark, and Duke of Schleswig-Holstein and Lauenburg: b. Copenhagen 18 Sept. 1786; d. there 20 Jan. 1848. He was chosen king of Norway in 1814, but unable to hold it against Bernadotte he abdicated in October of the same year. His reign was comparatively unimportant, the most notable event being the king's proclamation in 1846 that Schleswig and Holstein were inseparably united to Denmark. He was succeeded by his son, Frederick VII.

**Christian IX.**, king of Denmark: b. 18 April 1818. He was the fourth son of the Duke of Schleswig-Holstein-Sonderburg-Glücksburg, and succeeded Frederick VII. as king of Denmark, 15 Nov. 1863. His second son was, in 1863, elected king of Greece, and his two eldest daughters married heirs-apparent of the crowns of Great Britain and Russia.

**Christian**, German prelate: b. early part of the 17th century; d. Tusculum, Italy, 25 Aug. 1183. He was made archbishop of Mainz in 1165. He was chiefly celebrated for his military exploits under Frederick Barbarossa, for whom he opened the way to Italy. He fell in battle endeavoring to rescue Pope Lucius III. from a hostile Roman army.

**Christian, Charles**, English engraver: b. London 1684; d. there 1725. His real name was Charles Christian Riesen. He was the son of a Dane. He is one of the most celebrated of gem engravers. One of his best works is a portrait of Charles XII. of Sweden.

**Christian, Edward**, English jurist: b. London 1774; d. Cambridge 1823. He was chief justice of the Isle of Ely, and law professor of Downing College, Cambridge. He was the author of various works, among which are treatises on the bankrupt laws, and on the game laws. He also edited an edition of Blackstone, to which he added numerous notes.

**Christian, The**, a novel by Hall Caine, published in 1897. For the most part the scene is laid in the London of to-day. The details of London life are spectacular, and the object of the book seems to be to show the inadequacy of London churches to save the city.

**Christian Architecture**, a style of architecture adopted for religious buildings after the introduction of Christianity. The Roman Early Christian style appeared first in basilicas and circular churches. The former were, doubtless, originally built on the model of the Roman basilicas, but the requirements of the new religion soon necessitated various modifications in the original plan. The Christian basilicas were constructed generally with three aisles; the central one broader than the others, the left or north being reserved for males, and the right or south for females. Sometimes we find five aisles. The building terminated in a semi-circular apse. The decorations consisted of paintings and mosaics, used mainly in the apse. The pillars were generally of the Corinthian order. Symbols were largely introduced. These were the cross and the lamb, symbols of Christ,

the dove, as typifying the Holy Spirit, and a fish, used as a symbol of Christ from the letters of the Greek word *ichthys*—a fish, forming the initials of the titles of our Lord, *Iêsous Christos, Theou huios, sôter*—Jesus Christ, the Son of God, the Saviour. The roofing was of beams with flat paneling, frequently gilt. The altar stood at the east end in front of the apse. The space round the altar was railed off and called the sanctuary. Adjoining the entrance was generally a narrow space called the Narthex. In the middle of a portico in front of the building was a bowl for washing the hands. A crypt was constructed under the altar for the reception of the bones of the patron saint. See also **ARCHITECTURE**.

**Christian Brothers.** See **BRETHREN OF THE CHRISTIAN SCHOOLS**.

**Christian Brothers, College of**, situated in St. Louis, Mo. In 1855 it was established and incorporated with power to confer degrees. The modern language department is given special attention, the pupils being required to converse and write in French, German, and Spanish. Practical engineering, mechanical and scientific draughting and designing are emphasized in the scientific department. Literary and musical courses are aided by the various organizations which contribute to the development of good taste. The graduates of this college are among the distinguished men of the country.

**Christian Catholic Church.** See **DOWIE, JOHN ALEXANDER**.

**Christian Church, The**, is really the Church established by Jesus Christ when he was here upon earth. All are considered members of this Church who have been baptized in the name of Christ, and who accept his doctrines and live in harmony with them. (See Matt. xxviii. 19, 20.) The first great increase was at Pentecost, when 3,000 people were converted; and shortly after, through the teaching of the apostles, 5,000 were added to the Church. (See 'Acts.') Stephen was the first to suffer martyrdom for Jesus Christ. Paul made three great missionary tours, established churches in many places, and the result of his work, aided by the 12 apostles and disciples, was the organic unity of the Church in the first period of the Christian Era.

**Ancient Period, 30-750 A.D.**—The first part of this period was distinguished by great simplicity of doctrine and life, and zeal in extending the kingdom of Christ. Important centres were established, but the gospel was largely confined to the middle and lower classes. Controversies arose between the Gentile and Jewish Christians, but not to such an extent as to arrest steady progress. The heretical sects, with Saturnius, Basilides, and others at their head, were of no serious injury. The chief defenders of Christianity were Aristides, a Christian apologist, Justin Martyr, Melito, Tatian, Hermas. This was the time of great persecutions. There were 10 in all, the most serious being under the emperors Nero, Decius, and Diocletian. The Scriptures were collected into a canon, and the Church made great advance in numbers and territory. The most important writers were Ignatius, Irenæus, Origen, Tertullian, and Clement of Alexandria. The more serious schisms were produced

## CHRISTIAN CHURCH

through Felissimus, Novatus, and Miletus. The doctrinal controversies related chiefly to eschatology, human depravity, and the divinity of Christ. The Council of Nice (325 A.D.) was a great triumph for orthodoxy. It declared the essential Trinity of the Godhead, and settled for all time the divinity of Christ as a fundamental doctrine of Christian faith. The heresy of Arius was condemned. Persecution ceased, through the sympathy of the Emperor Constantine, who, in 313, removed all disabilities from Christians, and in 323 made Christianity the state religion of the Roman empire. Monasticism, a reaction against worldliness, increased rapidly. Julian the Apostate endeavored to revive paganism, but without avail. Pope Leo the Great greatly extended the authority of the Western Church. Mohammedanism paralyzed the Eastern Church for a time. Mohammed was born in Mecca, Arabia, 570; declared himself a prophet in 609; founded a new religion, based upon the Koran; conquered Arabia, and died in 632. He was succeeded by the caliphs, who conquered all north Africa, western Asia, and gained a foothold in Spain and the south of France. Mohammedanism was arrested in western Europe by Charles Martel, by the victory of Tours, in 732. The most important recent defeat of Mohammedanism in Europe has been the triumph of Russia over Turkey in the war of 1877, and the practical disruption of Turkey in Europe, and the liberation of the Christian provinces. Pope Gregory the Great ruled from 590 to 604. He organized orders, elaborated the Church festivals, and established a mission among the Anglo-Saxons. The Gospel spread rapidly through Great Britain and Germany. Christian art was patronized liberally by the Roman pontiffs. The close of the ancient period found the Latin or Western Church very vigorous and aggressive, but the Eastern Church in a stagnant condition.

*Medieval Period, 750-1517 A.D.*—This period falls into three great divisions: From Charlemagne to Gregory VII. (750-1073); from Gregory VII. to the flight of the Pope to France (1073-1305); from time of the Pope's residence in France to Reformation (1305-1517). The Middle Ages were the transition from the ancient to the modern period. The most important political events, all of which had a bearing on the Church, were the end of the Greek exarchate in Italy; the destruction of the Lombard kingdom, the organization of the Frank empire under Pepin, rise of the new Germanic Church, division of the Mohammedan caliphate, decline of the Greek empire, and development of the new Roman empire in the West. Charlemagne was the greatest mediæval ruler. He was victorious over many northern tribes, and increased the territory of the Church to vast proportions. He was a liberal patron of learning, and authorized a Latin version of the Scriptures. Alfred the Great of England reigned from 871 to 901, and was as distinguished for learning as for his power to rule. The Russian monarchy was founded by Ruric in the middle of the 9th century. At this time the evangelization of heathen nations progressed rapidly. The Hungarians, Bulgarians, Bohemians, Moravians, Wends, and Scandinavians accepted Christianity. Great disorders appeared in the Church at this time. Strifes arose over the

papacy, and the civil powers endeavored to dictate the appointments of bishops and the disbursements of ecclesiastical funds. The violent rule of the Mohammedans over Palestine excited the wrath of western Europe, and crusades were organized for the rescue of the country from the Moslems. There were seven crusades, extending from 1096 to 1272. Christian Europe failed, finally, to hold the country, but the general effect of the crusades was beneficial in the development of commerce, introduction of Oriental thought, and the knowledge of various Oriental sciences. Heretical movements were inaugurated through the Waldenses (1170); Wyclif (1324); John Huss (1373); the Moravian Brethren (1417). Mysticism greatly developed at this period (Tauler, Suso, Ruysbroek, Groot, Thomas à Kempis) and Savonarola (1480-97). Mendicant orders were established. The Inquisition was established in 1215 to check heresy.

*The Modern Period, 1517 to the Present.*—In the first quarter of the 16th century began the religious movement commonly called the Reformation. Martin Luther, born in 1483, a priest and Augustinian monk, began an agitation against the authority of the Pope. He published 95 theses against Rome, preached sermons and, in various ways sought to change some of the conditions which existed. He spread the Scriptures, which had previously been translated into German, and gained the co-operation of the German princes, and published sermons and other works against the Roman Catholic Church. Melancthon was the chief doctrinal writer of the Reformation. Erasmus labored in the department of New Testament criticism, but never left the Church. The leading Swiss reformers were Zwingli in eastern Switzerland, and the learned and austere Calvin in western. Farel stood next to Calvin in Geneva. The English Reformation had King Henry VIII. on its side, through no pious motives, but because the Pope would not sanction his divorce from Catharine of Aragon. This was the great opportunity for which the Reformers of England had been waiting. Under the royal protection Protestantism grew rapidly, but received a set-back in Queen Mary's reign. Under Elizabeth the Reformation was placed on a firm foundation. The Puritans were a reaction against what yet remained of the old faith and practices in the Church of England. Arminius, born 1560, in Holland, opposed the chief tenets of Calvinism. The Synod of Dort resulted in the political triumph of the Calvinists, and the expulsion of the Remonstrants, until the death of Maurice (1630). The Thirty Years' war (1618-48) was confined to the continent, and established the territorial boundaries of the Protestant and Catholic nations. The Huguenots were the representatives of Protestantism in France. The Jesuits, organized by Ignatius Loyola, 1540, were established as an offset to the aggression of Protestantism. Deism prevailed to an alarming extent in England, its chief promoters being Hobbes, Herbert, Shaftesbury, Tindal, Bolingbroke, Hume, and Gibbon. They had strong antagonists (Baxter, Cudworth, Taylor, Wateland, Leland, Butler, Paley), but the general condition of the people was irreligious. Methodism, which was begun by John Wesley, born 1703, was a fervent religious movement. Charles Wesley, Whitefield, John Fletcher, Joseph Benson, and Adam Clarke were strong coadjutors.

## CHRISTIAN ENDEAVOR—CHRISTIAN KNOWLEDGE

German Rationalism arose in 1750, through the teachings of Wolfe, Semler, and the example of the Prussian court. It is now in decline, through the labors of Tholuck, Neander, Hengstenberg, Ullman, and others. The Evangelical Alliance (1846) has sought to promote the unity of Protestant Christians in all parts of the world, and, to a corresponding degree, the victory over skepticism. The Old Catholics, a Roman Catholic reaction against the Vatican Council of 1869, were organized into a Church in 1870; Dollinger, Huber, and Friedrich were at their head. They have made but little progress.

*The American Church.*—The colonization of North America in some parts sprang from religious motives. The colonists sought freedom here because of the oppressions at home. Periods of American Church history: (1) From 1607-60, revival and progress. (2) 1660-1720, trial, disputes with Great Britain, religious decline. (3) From 1720-50, great revivals. (4) From 1750-83, political agitation, freedom from British rule. (5) From 1783 to the present, extensive revivals, separation of Church and state, abolition of slavery, evangelization. The Protestant Episcopal Church was founded by the James River Colony (1607); its first General Convention was in 1785; it ratified the 39 Articles in 1832. The Puritan Pilgrims landed at Plymouth in 1620, and began the development of Congregationalism. The Cambridge Platform was established in 1648. The Reformed (Dutch) Church was established in 1628 in New Amsterdam (New York). The first independent organization was in 1771. The Baptists began in Providence, R. I., in 1639, through Roger Williams. The Reformed (German) Church was organized in 1741. The Lutherans were established first in New York in 1669; the first Synod was held in 1748. The Presbyterians were organized at the close of the 17th century. The first Presbytery was established in Philadelphia in 1706, and the first General Assembly in 1789. The first Methodist Society in the United States was established in New York in 1766, and the first Conference was held in Philadelphia in 1771. The Reformed Episcopal Church was organized in New York in 1873, under Bishop Cummins. The Roman Catholic Church in the United States was first established in Maryland through immigration in 1632. The Episcopal see of Baltimore was established in 1789. For statistics of the American churches see the separate articles.

**Christian Endeavor, Young People's Society of**, a society distinctly religious in all its features; organized 2 Feb. 1881 in Williston Church, Portland, Maine, by the Rev. Francis E. Clark, D.D. From one small association it has expanded into over 57,000 societies, in all parts of the world, with an aggregate membership (1900) of 3,500,000. In addition to the main organizations in the United States it has been found necessary to form branches, among which are the Juniors, organized 27 March 1884, at Tabor, Iowa, by the Rev. J. W. Cowan and Miss Belle Smith; the Intermediate, organized by the Rev. A. Z. Conrad of Worcester, Mass.; and the Mothers', suggested by Mrs. Amanda B. Fellows of Chicago, and organized in April 1893 at Topeka, Kan., by Mr. F. C. Barton. Among other special branches are the Life Savers', instituted by the Rev. S. Edward Young at the United States Life-Saving Station at Asbury Park, N. J.; the Travelers' Christian

Endeavor Union, organized at Philadelphia, 14 Nov. 1892, for work among commercial travelers; the Floating societies for work in the United States navy and among seamen generally; and various other organizations whose fields of labor lie among the Chinese, the Indians, convicts in prison, etc. The first Christian Endeavor Society in England was organized in 1887, and was followed by similar ones in other countries, and the constitution has been printed in over 30 different languages. The movement is not a denominational one. Any society belonging to an evangelical Church, which adopts the leading principles as set forth in the constitution, including the prayer-meeting pledge, and which guarantees these principles by the name Christian Endeavor either alone or in connection with a denominational name is admitted to all the privileges of the organization. In the United States the Presbyterian Church has the largest number of societies; in England the Baptists lead; while in some parts of Canada and Australia, the Methodists are in advance of all others. In some of the American States, the Disciples of Christ, and in others the Congregationalists, claim the largest number.

The distinctive features in the Christian Endeavor movement are its work among the young people, leading them to consecrate their lives to the active service of God; the weekly prayer-meetings, which each member takes a solemn pledge to attend regularly (unless unavoidably detained), and to take part in; and the reconsecration meetings held once a month, at which special efforts are made to see if each one has been faithful to his pledges. The amount of good accomplished in training the young people in the practical work of Christianity and fitting them to take up the work of those dropping out of active service can never be fully estimated. The World's Union of Christian Endeavor held its first triennial convention at Washington, D. C., in July 1896, which was attended by representatives from all over the world. Rev. Dr. Clark was elected president, and Rev. W. J. L. Closs of Australia was made the first secretary of the new organization. The United Society of Christian Endeavor is a bureau of information, which simply seeks to spread the idea of the movement throughout the world. Its headquarters are in Boston, and John Willis Baer is the secretary.

FRANCIS E. CLARK.

**Christian Era**, the era or epoch introduced by the birth of Christ. It was calculated back about the year 532, by a monk, Dionysius Exiguus (the latter word, meaning little, being assumed either because his stature was diminutive or because he modestly believed his mental powers small, which they were not). Dionysius was a resident of Syria. It is thought that he fixed the advent too late by four years, and that consequently Jesus was born, if the contradiction in terms can be permitted, in 4 B.C. J. W. Bosanquet considers that it was in 3 B.C. The Christian Era is sometimes called the Dionysian era. The Rev. Charles Force Deems, D.D., an eminent American clergyman, in his 'Jesus,' places the birth 'about the beginning of August, 6 B.C., 747 A.U.C.'

**Christian Knowledge, Society for the Promoting of**, the oldest and greatest of the great religious associations connected with the Church of England. It is popularly referred to as the

## CHRISTIAN SCIENCE

"S. P. C. K." It was founded in 1698, although it did not receive its present name till 1701; and had for its objects:

'1. To promote and encourage the erection of charity schools in all parts of England and Wales; 2. To disperse, both at home and abroad, Bibles and tracts of religion; and, in general, to advance the honour of God, and the good of mankind, by promoting Christian knowledge both at home and in other parts of the world by the best methods that should offer.' These objects it has never ceased to pursue, chiefly directing its efforts to Great Britain and the colonies; partaking at once of the nature of an educational association, a missionary society, a Bible society, a religious tract society, and an emigrants' spiritual aid society; and notwithstanding the operations of other great societies in these several departments of Christian benevolence, its revenue amounts to above \$250,000 a year. The publishing and bookselling business shows in some years total sales of \$450,000; the works published being in very various departments of literature, and including several admirable series on Early Britain, Diocesan Histories, Ancient History from the Monuments, Early Chroniclers, &c

The Protestant missionaries who labored in the south of India in the 18th century were supported chiefly by this society, and it is now chiefly engaged in supplying to the mission-field throughout the world needful religious literature in the vernacular. Besides translations of the Bible and Prayer-book, it provides for pioneer missionaries, grammars, dictionaries, reading-books, and general literature, to instruct them in the languages which they will have to use. In Scotland a similar society was organized in 1709, and in 1902 had an annual expenditure of \$25,000.

**Christian Science.** For a definition of Christian Science it is sufficient to quote one that has frequently been used and which will be acceptable to Christian Scientists generally: "The foundational truths of Christian Science are the reality and allness of God, the unreality and nothingness of matter, the spirituality of man and the universe, the omnipotence of good, the impotence of evil. The demonstrative actuality of Christian Science essentially distinguishes it from all other religions of the age." As presented in 'Science and Health with Key to the Scriptures,' by Mary Baker G. Eddy: "The physical healing of Christian Science results now, as in Jesus' time, from the operation of divine Principle, before which sin and disease lose their reality in human consciousness, and so disappear as naturally and as necessarily as darkness gives place to light, and sin to reformation. Now, as then, his mighty works are not supernatural, but supremely natural. They are the sign of Immanuel, or 'God with us'—a divine influence ever present in human consciousness, and repeating itself, coming now again, as was promised aforetime,

To preach deliverance to the captives (of sense),  
And recovering of sight to the blind,  
To set at liberty them that are bruised."

(Preface, p. xi.)

Its purpose is not to supplant primitive Christianity, but to render our understanding of it more practical. It is the claim of Christian Scientists that Jesus proved what man may do

through absolute reliance upon God, and Mrs. Eddy teaches how it may be done.

The principal mission of Christian Science is to give an enlarged spiritual explanation of the infinite personality of God as Spirit, to define the very nature and essence of God, and thereby increase mortals' faith and trust in Him. Christian Scientists believe that God should be recognized in all the affairs of men.

The history of Christian Science dates back to 1866, the year of Mrs. Eddy's discovery, and the growth of the movement during subsequent years has been so rapid that the denomination now commands a position of wide influence and power. Mrs. Eddy, the recognized discoverer and founder of Christian Science, began to win followers in 1867. In 1875 she published 'Science and Health with Key to the Scriptures,' the text-book of Christian Science, which has passed through more than 290 editions of 1,000 copies each. In 1879 she founded the first Christian Science Church, and in 1881 she opened a college for the teaching of Christian Science, called the Massachusetts Metaphysical College, where she personally taught about 5,000 students, who passed through this college. In 1883 she established the first denominational periodical and became its editor.

In Mrs. Eddy's personal history there is nothing mysterious or concealed. She has never made any miraculous claims. Her life has been simple, her girlhood, save for its eager religious questioning, not unusual. She was born in a little village in New Hampshire, sheltered by the hills that rose to the soft blue skies, and sentinelled by oak and pine and hemlock. Here the Baker homestead stood, and here Mary Baker's girlhood days were spent. To this charming New Hampshire village, now greatly changed, come small parties of Christian Scientists during the summer months, eager to tread the paths familiar to the beloved founder of their faith. These visits are a remarkable evidence of the love which Mrs. Eddy has inspired, and bespeak the power of her influence over so many hearts.

She comes of that mixed English and Scotch Puritan ancestry which formed so much of the best of New England's stock. Some of her forefathers were men of mark in war and statesmanship. Gen. Knox, of Revolutionary fame, was a relative of her father, and among others of her ancestors were Sir John Macneil, who fought at Lundy's Lane. Mary Baker's father was a man of sturdy piety and strict probity. Of Mrs. Eddy's mother the little that has been recorded leaves the impression of one of those New England mothers whose strict notions of propriety were tempered by an innate sweetness of temperament. From her brother, Hon. Albert Baker, who was nominated for a congressman by the largest vote ever polled in New Hampshire (dying, however, before his election), Mrs. Eddy derived her knowledge of Greek, Hebrew, and Latin. Charity and benevolence ruled the household. Mrs. Eddy speaks of her childhood's home as "one with the open hand, where the needy were ever welcome." From such a family and such a home, full of the beautiful simplicity of the rural life of early New England, came the only woman in history who has ever founded a great religious denomination.

Doctrinal questions early engaged her eager

## CHRISTIAN SCIENCE

and active mind. In her book, 'Retrospection and Introspection,' she has described how she cast from her the doctrine of predestination, in which belief she had been carefully nurtured by her Calvinistic parents. Her soul revolted from what she regarded as the inhumanity of extreme Calvinism, and before the meeting, where she applied for church membership, she bravely disavowed a belief in those tenets. Thereafter she was active in church work, engaging in much speaking and writing. Three years she spent in Scripture study in the preparation of her work, 'Science and Health.'

Of this period she writes: "For three years after my discovery I sought the solution of this problem of mind-healing; searched the Scriptures, read little else; kept aloof from society, and devoted time and energies to discovering a positive rule. The search was sweet, calm, and buoyant with hope, not selfish nor depressing. I knew the principle of all harmonious mind-action to be God, and that cures were produced, in primitive Christian healing, by holy, uplifting faith; but I must know its science, and I won my way to absolute conclusions, through divine revelation, reason, and demonstration. The revelation of truth in the understanding came to me gradually, and apparently through divine power" ('Science and Health,' p. 109)

The love in which Mrs. Eddy is held by Christian Scientists—and there is no mistaking the reality or genuineness of the affection—is called forth by what she has wrought, and goes out to her as the bearer of a great spiritual message. This is expressed in the speech and writings of Christian Scientists and is a constant tribute to the wisdom and success of her leadership. It is true that they regard her as the greatest woman of her time; considered in her relation to religious truth, the greatest of all time. But this is very different from fulsome adulation, or from the vulgar attribution of miraculous powers.

The total number of Christian Science churches and societies, here and abroad, in June 1903, was 769, showing the remarkable increase of 228 in three years. Greater New York has nine Christian Science churches; Chicago, six; Minneapolis, four; Milwaukee, three. The doctrines of Christian Science have secured a firm foothold in Great Britain and Germany, and the present indications are that the growth of the denomination in those conservative countries will be as rapid as in the United States and Canada. The directory of practitioners published in a recent issue of the official organ of the denomination includes the names of persons in 49 States and Territories of the United States, including Hawaii, the Philippine Islands, and Porto Rico; England, Ireland, Scotland, Wales, Canada, France, Germany, Italy, Switzerland, Australia, Mexico, China, and the Bahamas. Besides the churches there are many free reading-rooms—more than 450 in the United States alone. These reading-rooms are a feature of the denomination, and are to be found in many of the cities abroad where Christian Science has found lodgment.

The First Church of Christ, Scientist, in Boston, Mass., was finished in 1894 at an expense of over \$250,000 and was dedicated free of debt, in fact it was necessary to issue notice that no more contributions would be received. It is known as the "Mother Church," all the

other churches being branches of this one. This was the first church devoted to the uses of the denomination, and all the others have, therefore, been built within nine years, a very remarkable growth.

In recent years the growth of the congregation in attendance at the Mother Church has been so great that branch churches have been established in Roxbury, Cambridge, and Chelsea, but the relief thus gained has not been sufficient, and work has recently been commenced upon a larger building which will have a seating capacity of 5,000 and will cost over \$1,000,000.

The denomination, numerically, is very evenly distributed. The "Directory of Christian Science Practitioners" in 'The Christian Science Journal' shows that there is hardly a city in the Union but contains within it one or more adherents of the faith who devote their entire time to healing the sick. Then, too, the Board of Lectureship, comprising well-known and representative men and women, is a growing and efficient means of spreading a knowledge of the new doctrines.

The Mother Church in Boston included in June 1903, according to official figures, 27,796 members, 3,696 of whom had been added since the preceding June. Membership in this church is not confined to Christian Scientists residing in Boston.

The growth of the denomination has not been due to any effort on the part of Christian Scientists to proselyte from or misrepresent other denominations, but rather to the fact that the practical application of the teachings of Christian Science has proved beyond contention to thinking people who have investigated the subject that salvation is possible and within the reach of all who faithfully and earnestly strive for it. It is not the purpose of Christian Scientists to interfere with those who are satisfied with their religious beliefs, nor do they seek to force their views upon those who do not agree with them.

The nine years succeeding the building of the Mother Church have constituted a period of great activity and growth, especially in the way of church-building, and in many of the smaller cities and towns, as well as in the larger cities of the country, large and in some instances quite expensive edifices have been erected. It is an unwritten law of the denomination that a church building shall not be dedicated until it is paid for. Some congregations have built chapels to which they propose to add churches as the need arises; others have purchased old churches or family mansions, which they have remodeled and refurnished to meet their requirements, while a number have bought sites on which building operations will shortly be begun. In all this activity there is evidence of the great outlay of time, services, and money, which are given not only cheerfully, but eagerly; and all this has gone on at a steadily increasing pace, to which one can as yet see no probability of interruption. Early in 1904 there was in course of construction in Concord, N. H., a fine church edifice which represents a gift of \$120,000 by Mrs. Eddy to the Christian Scientists of her home city.

Organized Christian Science is perhaps less than seven years old in England. From 1894 to 1897 its meetings in London were confined to drawing-rooms, but in the latter year a regular meeting-place was engaged. But it was not until

## CHRISTIAN UNION CHURCHES — CHRISTIANA CASE

1899 that First Church of Christ, Scientist, in London, was formed, followed later by Second Church of Christ, Scientist.

In Germany there has been some progress. Berlin has a church organized some time ago with the permission of the authorities, as is usual in such cases. In that city is a Christian Science reading-room maintained by the church organization. The question of the new faith came up in the Reichstag, and the imperial secretary of state then said: "I warn earnestly against using the power of the state against such things."

Wherever established, the Church numbers among its adherents men and women of distinguished intellectual ability. There as here, they are largely recruited from the professional ranks — judges, lawyers, doctors. Critics of the new denomination have frequently noted that the membership of the Church represents the "upper classes" — the classes which socially are near the apex, but while this is in some measure true, it is not to be understood that the Christian Science Church is "a rich man's church." On the contrary it is most democratic, and its members have been drawn from almost every rank and condition of society.

Practically all the adherents of Christian Science have been healed of severe and chronic sickness which in past years impoverished many of them or rendered the transaction of business and the earning of more than a meagre livelihood a physical impossibility. These people, now being restored, through the recovery of their health, to their legitimate place in the business and social world, give an air of prosperity to the congregations of which they are members.

A distinctive feature of the religious services of the denomination is the "Wednesday evening meeting" at which testimony is given by those who have been healed of physical disease or reformed from the practice of sinful habits, through the operation and practice of Christian Science. It is proverbial that every religious reformer has had to overcome prejudice and opposition, and in this regard the founder and leader of Christian Science is not an exception.

It should be remembered that there are no personal pastors in the Christian Science churches. This rule is observed with a view to the emphasizing of truth rather than personality. The place occupied in other churches by pastors is filled by trained and educated leaders called readers.

In the early years of Mrs. Eddy's work she met much opposition from those to whom it seemed impossible that the healing work of Jesus and the apostles should be revived, but this opposition and the prejudice from which it sprang is becoming less and less each year until Christian Science has now taken its place as a practical and beneficent religion, and it is so regarded by a constantly increasing and ever loyal constituency.

Certainly few teachings have made greater progress in the world than the faith to which the name of Mrs. Eddy is linked. Christian Science is no mere exclusive tenet, held by a small knot of believers. It is a growing and important faith, ranking in the number of its adherents with the great established denominations of Protestantism. Entertain what views its critics may of the basic doctrine advanced under the name of

Christian Science, certainly the charge of fanaticism cannot be in any way successfully maintained.

In a quiet, undemonstrative way its adherents have gone about their task; there has been no proselyting, in the usual sense of that term; there have been no sensational sermons, such as attract vast metropolitan audiences. With none of these adventitious aids to the spread of its doctrines, Christian Science has made extraordinary progress. It has moved like an army and, ere the world was aware of it, the great host had taken its place among the foremost of the established religious orders of the universe. Consult the works of Mrs. Eddy and the 'Christian Science Journal' (Boston)

ARCHIBALD McLELLAN,

*Editor Christian Science Journal.*

**Christian Union Churches**, an American denominational union, organized in 1805, composed of members of all varieties of orthodox belief. Their creed is simple, covering the headship of Christ, sufficiency of the Bible, and right of local Church government. They have a membership of about 30,000 and fully 150,000 adherents, and are located chiefly in the older western States. In 1899 they had approximately 183 ministers, and 294 churches. They are in affiliation with the Christians.

**Christian University**, a co-educational institution in Canton, Mo.; organized in 1853, under the auspices of the Disciples of Christ; reported at the end of 1899: Professors and instructors, 22; students, 150; volumes in the library, 1,000; grounds and buildings valued at \$40,000; productive funds, \$18,000; benefactions, \$1,200; income, \$5,000; number of graduates, 227; president, Clinton Lockhart, A. M., Ph D.

**Christian Woman, A**, a novel by Enilia Pardo-Bazán. In this interesting tale the author presents a very realistic picture of modern Spanish life, into which are introduced many current social and political questions.

**Christian Year, The**, by John Keble, an English divine. The book is a small volume of religious poems, which first appeared in 1827. It contains a thought or thoughts, expressed in poetic form, for each day of the year. The poems have all the polish and simplicity which come from classical study and artistic workmanship. The book, at once, became popular, and has held favor ever since. Cardinal Newman said of this work: "It was the most soothing, tranquilizing, subduing work of the day. If poems can be found to enliven in dejection and to comfort in anxiety, to cool the over-sanguine, to refresh the weary, and to awe the worldly, to instill resignation into the impatient and calmness into the fearful and agitated, they are these." See KEBLE, JOHN.

**Christiana Case**. On 11 Sept. 1851, Edward Gorsuch of Maryland, his son, a party of friends, and a United States deputy marshal, having secured a warrant from a Philadelphia commissioner for the arrest of a fugitive slave (alleged to have been Gorsuch's own son), came to Christiana, Lancaster County, Pa., approached the house where the fugitive had taken refuge, and demanded possession of him, firing two shots at the house. The neighborhood was aroused, and several armed colored men appeared on the scene, as also did Castner

## CHRISTIANCY — CHRISTIANITY

Hanway and Elijah Lewis, Quakers, who tried to persuade both parties to disperse. The deputy marshal ordered them to join his posse; they urged him to withdraw for his own sake; Gorsuch and two of his party fired on the colored men, who returned the fire, killed Gorsuch and his son, and forced the rest to fly. The fugitive slave escaped. The two Quakers were indicted for treason; the grand jury found bills against them; and they were tried 24 November before Justice Grier of the supreme court. Among the counsel for their defense were Thaddeus Stevens and T. L. Cuyler; the chief argument was by J. M. Read. The absurdity of the accusation was so great that the Democratic judge charged emphatically for the prisoners, and the jury acquitted them without leaving the box.

**Christiancy, Isaac Peckham**, American editor and diplomatist: b. Johnstown (now Bleeker), N. Y., 12 March 1812; d. Lansing, Mich., 8 Sept. 1890. He was one of the founders of the Republican party and espoused its cause as editor of the 'Monroe Commercial.' In 1875 he was chosen United States senator from Michigan, and in 1879 became minister to Peru.

**Christiania**, krēs-tē-ä'nē-ä, Norway, capital, city and port, province Aggershuus or Christiania, at the head of the long narrow inlet called Christiania Fjord, about 60 miles from the open sea or Skager Rack. High hills rise around it on all sides, excepting toward the bay, but at considerable distances, particularly on the north. The most interesting building in the town is the fine old castle of Akershus (built about 1300), with its church and planted ramparts, crowning a point jutting out into the fjord, and commanding a fine view, but of no military value. On a gentle elevation, and in the midst of a beautiful park stands the royal palace—a massive square building, without any architectural ornament, but commanding delightful views of the fjord and its beautifully winding shores. The hall in which the Storthing holds its sittings is a very plain building. The other public edifices are the military academy, cathedral, university, etc. Attached to the university is a museum, containing a fine collection of antiquities. The climate of Christiania is delightful. It is screened from violent winds; and even in winter, though the cold is severe, the weather is seldom variable, but bright and settled, and free from damp and fog. In summer it is warm but not sultry, with a light and buoyant atmosphere. The few manufactures of the city consist of woolen cloth, iron-ware, tobacco, paper, leather, soap, spirits, glass, etc. There are also some extensive breweries. The exports are principally timber, deal planks, and iron. The environs of the city are exceedingly beautiful, the approach to it by the magnificent fjord, at the head of which it is situated, exciting the admiration of all visitors. The fjord is frozen for upward of two months in the year, for about 20 miles from Christiania to the sea; and the harbor is generally locked up for three or four months. Pop. 203,337.

**Christianity**, the religion instituted by Jesus Christ. Christianity, as it now exists in our minds, has received, from the influence of national character, of the spirit of the time, and

the thousand ways in which it has been brought into contact with politics and science, a variety of impure additions, which we should first separate in order to understand what it is in reality. There could be no better means of attaining a correct understanding of it than to investigate, historically, the religious principles which Jesus himself professed, exhibited in his life, and labored to introduce into the world, if the investigator could avoid giving the coloring of his own views to his explanation of the records of the origin of Christianity. But the most honest inquirers have not entirely succeeded in so doing. Even the Christian theologians of the present age, though divided less by the spirit of creeds and parties than of scientific methods and philosophical speculations, dispute respecting the principle that constitutes the basis of the religion of Christ. This principle appears, by its effect upon the numerous nations, differing so greatly in intellectual character and cultivation, which received Christianity at first, to have been a universal truth adapted to the whole human race, and of a divine all-uniting power. The Jews believed in a living God, the Creator of all things, and, so far, had just views of the source of religion. The Greeks, besides developing the principle of the beautiful in their works of art, had laid the foundations of valuable sciences applicable to the business of life. The Romans had established the principles of law and political administration, and proved their value by experience. These scattered elements of moral and intellectual cultivation, insufficient in their disunited state to bring about the true happiness and moral perfection of man in his social and individual capacity, were refined, perfected, and combined by Christianity, through the law of a pure benevolence, the highest aim of which is that of rendering men good and happy, like God, and which finds in the idea of a kingdom of heaven upon earth, announced and realized by Christ, all the means of executing its design. His religion supplied what was wanting to these nations—a religious character to the science of Greece, moral elevation to the legislative spirit of Rome, liberty and light to the devotion of the Jews—and, by inculcating the precept of universal love of mankind, raised the narrow spirit of patriotism to the extended feeling of general philanthropy. Thus the endeavors of ancient times after moral perfection were directed and concentrated by Christianity, which supplied at the same time a motive for diffusing more widely that light and those advantages which mystery and the spirit of castes had formerly withheld from the multitude. It conveyed the highest ideas, the most important truths and principles, the purest laws of moral life to all ranks; it proved the possibility of perfect virtue through the example of its Founder; it laid the foundation for the peace of the world through the doctrine of the reconciliation of men with God and with each other; and, directing their minds and hearts toward Jesus, the Author and Finisher of their faith, the crucified, arisen, and glorified Mediator between heaven and earth, it taught them to discern the benevolent connection of the future life with the present. The history of Jesus, and the preparations of God for his mission, afforded the materials from which Christians formed their conceptions of the character and tendency of their religion.

## CHRISTIANITY AND ISLAM—CHRISTIANITY IN CHINA

The first community of the followers of Jesus was formed at Jerusalem soon after the death of their Master. Another at Antioch in Syria first assumed (about 65) the name of Christians, which had originally been given to them by their adversaries as a term of reproach; and the travels of the apostles spread Christianity through the provinces of the Roman empire. Palestine, Syria, Asia Minor, Greece, the islands of the Mediterranean, Italy, and the northern coast of Africa, as early as the 1st century, contained societies of Christians. Their ecclesiastical discipline was simple and conformable to their humble condition, and they continued to acquire strength amidst all kinds of oppression. At the end of the 2d century Christians were to be found in all the provinces, and at the end of the 3d century almost a half of the inhabitants of the Roman empire and of several neighboring countries, professed this belief.

From the first council of the Church held in Jerusalem, before the apostles dispersed to teach all nations, the followers of Christ strove to keep united, to preserve the faith and discipline left them by their Founder. When any person or persons of influence advanced a teaching which seemed to Christians to be not in accord with the faith as given to them by Christ, it was customary to call together the bishops, as at Jerusalem, and discuss the disputed questions, in order to learn by traditional and historical evidence the truth. Such meetings or assemblies when called by the Bishop of Rome were known as General Councils, but if by any other bishop they were called provincial councils. Certain scholarly men who were zealous in the cause of Christianity gathered together the authoritative teachings and generally accepted traditions of the times, and thus left on record the history of the first years of Christianity from theological and dogmatic points of view. These men are styled fathers or doctors of the Church. The teachings of the councils and the fathers were potent factors in fostering unity among Christians. Those who did not accept the teachings of the councils were called heretics.

Christianity was introduced among the Goths in the 4th century, and spread among the other Teutonic nations in the west and north of Europe, and subjected to its power during the 7th and 8th centuries the rude warriors who founded new kingdoms on the ruins of the Western empire. Meanwhile, however, it was losing ground in Asia and Africa before the encroachments of the Saracens, by whose rigorous measures hundreds of thousands of Christians were forced into Mohammedanism, the heretical sects which had been disowned by the orthodox Church being almost the only Christians who maintained themselves in the East.

During the progress of Mohammedanism, which, in Europe, originally extended only to Spain and Sicily, the Roman popes, who were advancing systematically to full ecclesiastical superiority in the west of Europe, gained more in the north, and soon after, in the east of this quarter of the world, by the conversion of the Slavonic and Scandinavian nations (from the 10th to the 12th century), than they had lost in other regions. For the Mohammedans had chiefly overrun the territory of the Eastern Church, which had been since the 5th century no longer one with the Western (Latin) Church,

and had by degrees become entirely separate from it. In the 10th century it received some new adherents by the conversion of the Russians, who are now its most powerful support. But the Crusaders, who were led partly by religious enthusiasm, partly by the desire of conquest and adventures, to attempt the recovery of the holy sepulchre, gained the new kingdom of Jerusalem, not for the Greek emperor, but for themselves and the papal hierarchy. The confusion which thus finally unsuccessful attempt against the infidels introduced into the civil and domestic affairs of the western nations gave the Church a favorable opportunity of increasing its possessions and asserting its claims to universal monarchy. But, contrary to the wishes and expectations of the rulers of the Church; the remains of ancient heresies were introduced into the West through the increased intercourse of nations and by the returning Crusaders, and new ideas of another sort were also propagated, springing from the philosophical spirit of examination of some of the schoolmen.

Wickliff in England and Huss in Bohemia began attacks on the popes and bishops because of abuses which had crept into the Church. Their action led to a revolt against ecclesiastical authority which resulted in many leaving the Roman Catholic Church. In regard to the movement that took place in the next century, and in which Luther was the great actor, we refer the reader to the article REFORMATION, and the articles relating to it. The Reformation is naturally regarded with widely different sentiments by Protestants and Roman Catholics. But that this great change in the Church has restored Christianity to its original simplicity and purity the most zealous Protestant will not assert, any more than the reflecting Catholic will deny the necessity that then existed for some reform—a necessity which indeed resulted in the holding of the Council of Trent. On this subject a Roman Catholic writer remarks that "The true and Catholic Reformation, long desired, but delayed by many difficulties, was taken up and successfully accomplished by the Council of Trent (1545-63)."

No one can claim, rightfully, the name of Christian unless he is a believer in the divinity of Jesus Christ, but Christianity or the teachings of Jesus Christ are believed and practised by many who do not believe that Jesus Christ is God.

**Christian'ity and Is'lam: the Bible and the Koran**, the title of a work by the late Dean of Winchester, William Richard Wood Stephens, published in 1877. This book presents the estimate of Mahomet's mission and its results, which seems fair to a conservative English Churchman. It is his desire to do justice to the teachings of the Koran, and to make a full admission of the inherent defects and vices of the races over whom the influence of this code of faith and conduct has certainly been salutary, and even spiritualizing. That is, he attributes to blood the evil tendencies and characteristics too often attributed to religion.

**Christian'ity in China, Tartary and Tibet**, a work by the Abbé Huc, published in 1857-8. It is a curiously interesting and elaborate history of the presence in the Chinese empire of Christian missions from the time of the Apostles to the end of the 17th century. The author

## CHRISTIANS — CHRISTIE

was a Roman Catholic missionary in China, 1840-52. By shaving his head, dyeing his skin yellow, and wearing a queue and Chinese costume, and by a thorough command of the Chinese language, he was able to travel not only in China Proper but in Tibet and Tartary. He published in 1850 an exceedingly interesting account of his travels during 1844-6, and in 1854 a work on the Chinese empire. His first work related marvels of travel which aroused incredulity; but later researches have amply shown that this was unjust. The final work, connecting the history of the Chinese empire with the maintenance through centuries of Christian missions, is a work of great value for the history of the far East.

**Christians, Christian Connection, etc.,** the name of a denomination in the United States and Canada, adopted to express their renunciation of all sectarianism. They have become well known in all parts of the country, the number of their churches being estimated at over 1,000, with more than 250,000 communicants. Each church is an independent body: they recognize no creed, no authority in matters of doctrine: the Scriptures, which every individual must interpret for himself, are their only rule of faith: admission to the Church is obtained by a simple profession of belief in Christianity: speculative belief they treat as of little importance, compared with virtue of character. In New England they separated principally from the Calvinistic Baptists: in the southern States from the Methodists; and in the western from the Presbyterians. There was therefore at first a great diversity of opinion and practice among them, each church retaining some of the peculiarities of the sects from which it seceded. To maintain a connection between the different churches, one or more conferences are formed in each State, consisting of members delegated from each church. There are now more than 70 of these conferences, which again form, by delegation, the United States General Christian Conference. They have several periodical works, and several institutions of learning, Antioch College being the most celebrated. They consider Christ as the Son of God, miraculously conceived, whose death was a ratification of the new covenant, not a propitiatory sacrifice; and the Holy Ghost or Spirit as the power or energy of God, exerted in converting the wicked and strengthening the good. They hold to the inspiration and divine authority of the Bible, which they allow everyone to interpret for himself.

**Christians of St. John,** a sect of religionists found in Asiatic Turkey, chiefly in the neighborhood of Bassorah. They profess to follow the teaching of John the Baptist, and are wrongly called Christians since they reject Christ, and are practically heathens, whose deities are darkness and light. They are called also Mendeans, Mendaïtes or Mandaites, and Sabians.

**Christians of St. Thomas,** the name of a sect of Christians on the coast of Malabar, in southern India, to which region the apostle St. Thomas is said (by a tradition that has little to justify it) to have carried the gospel. The facts of their history are not well made out. They originally belonged probably to a body of Christians who, in the year 499, united to form

a Syrian and Chaldaic Church in eastern Asia, and who were adherents of the doctrines taught by the heretic Nestorius. At an early date (7th century) the Persian Church had adopted the name of Christians of St. Thomas, and the Christians of Malabar received bishops from Persia. Latterly the Christians of St. Thomas gained the position of a military caste which locally had considerable power. When the Portuguese gained a position in Malabar these Christians were forced to join the Roman Catholic Church (1599). But in 1653 many of them renounced this union, and having in 1665 received a bishop sent by the patriarch of Antioch, they have since belonged to the Jacobite body of eastern Christians. The Church is now under seven bishops with a patriarch at the head; and the adherents number about 300,000. They give communion in both kinds, and in some other matters differ from the Roman Catholic Church. They allow the consecration of a married layman or deacon to the office of priest. Their churches contain no symbols nor pictures except the cross. Their liturgy is similar to the Syrian, and the Syrian language is used in it. At present they are, under the British government, free from any ecclesiastical restraint, and form among themselves a kind of spiritual republic, in which the priests and elders administer justice, using excommunication as a means of punishment. See 'The Indian Empire,' by Sir W. W. Hunter.

**Christiansand,** kris'tē-än-sänd, Norway, a city in the southern part of the country, situated on a sandy plain. It was built by Christian IV. in 1641; and has been the capital of its province or stift since 1684. It has several dockyards, a good harbor, much used for refuge, and a considerable trade in timber, pitch, stockfish (salted cod), fish-oil for curriers, salmon, mackerel, and lobsters, the latter chiefly for the London market. Shipbuilding is a considerable industry. Christiansand has a cathedral and grammar-school, and is the residence of a bishop. The streets are wide, straight, and regular; the houses are built of wood and detached, presenting altogether a remarkably colonial appearance. The inhabitants are noted for their tall stature. Pop. 13,000.

**Christianstedt,** kris'ti-än-stët, Danish West Indies, a seaport in the island of Santa Cruz, situated on the north shore. The harbor is difficult of access, being encumbered with many shoals, one of which stretches out nearly two miles to seaward in a northeasterly direction. This city is the capital of the Danish West Indies. Pop. 9,600.

**Christie, kris'ti, Francis Albert,** American theological writer: b. Lowell, Mass., 3 Dec. 1858. He was educated at Amherst College and studied theology at the universities of Berlin, Heidelberg, and Marburg 1889-93. Since September 1893 he has been professor of Church history at Meadville (Pa.) Theological School. He has written on theological and historical themes for various periodicals.

**Christie, James,** English clergyman: b. Otterburn, Northumberland, 14 July 1837. He was the son of a Presbyterian pastor at Otterburn, whom he succeeded in the pastorate in 1862, and since 1870 has been pastor of the Fisher Street Presbyterian Church at Carlisle. He has held several important professional posts,

## CHRISTIE — CHRISTINA

being moderator of the Presbyterian Church of England in 1901, and has published 'Men and Things Russian'; 'Northumberland'; 'The Moderator's Wander-Jahr.'

**Christie, James Elder**, Scottish artist: b. Guardbridge, Fifeshire, 5 Jan. 1847. He received an art training at South Kensington, and the Royal Academy. He was awarded a gold medal at South Kensington in 1875, and another from the Academy in 1877 for historical painting. Among important works by him are 'Tam O'Shanter' (1879); 'Pied Piper of Hamelin' (1881); 'A Lion in the Path' (1888); 'The Four Maries' (1889); 'The Red Fisherman' (1893); 'Gather Ye Rosebuds.'

**Christie, Richard Copley**, English scholar: b. Lenton 22 July 1830; d. Ribsdon 9 Jan. 1901. He was educated at Oxford, studied law and practised his profession 1857-77. He was professor of political economy at Owens College, Manchester, 1854-66, and was chancellor of the diocese of Manchester 1872-94. After retiring from his profession he gave much time to bibliographical research, and besides contributing to the 'Dictionary of National Biography' he published 'Étienne Dolet, the Martyr of the Renaissance' (1880); 'Old Church and School Libraries of Lancashire' (1885); 'Letters of Sir Thomas Copley.' He gave to Owens College the Christie Library, opened in 1898, and at his death bequeathed his library of 75,000 volumes to the same institution. See 'The Athenæum,' 19 Jan. 1901.

**Christie, William Henry Mahoney**, English astronomer: b. Woolwich 1 Oct. 1845. He was a graduate of Trinity College, Cambridge, and for a long time assistant in the Royal Observatory of Greenwich. On the retirement of Airy (q.v.) as astronomer royal in 1881, Christie was appointed his successor, a position which he still holds. He has written a 'Manual of Elementary Astronomy' (1875), but is best known for his spectroscopic work with the Greenwich Equatorial, especially that relating to the motion of stars in the line of sight.

**Christie Johnstone**, a story by Charles Reade, published in 1855. The story, by turns pathetic and humorous, abounds in vivid and dramatic scenes of Scotch life by the sea.

**Christina**, krís-tě'na, queen of Sweden: b. Stockholm 9 Dec. 1626; d. Rome 19 April 1689. She was a daughter of Gustavus Adolphus, and her education was conducted in a masculine manner. After the death of Gustavus in 1632 the States-General appointed guardians to the Queen Christina, then but six years old. These were the five highest officers of the crown, who were intrusted at the same time with the administration of the kingdom. The education of Christina was continued according to the plan of Gustavus Adolphus. She learned the ancient languages, history, geography, politics, and renounced the pleasures of her age in order to devote herself entirely to study. In 1644 she took upon herself the government. A great talent for business, and great firmness of purpose, distinguished her first steps. She terminated the war with Denmark, and obtained several provinces by the treaty concluded at Brömsebro in 1645. She then, contrary to the advice of Oxenstiern, who hoped to gain, by the continuance of the war, still greater advan-

tages for Sweden, labored to re-establish peace in Germany, in order to be able to devote herself uninterruptedly to the sciences and the arts of peace France, Spain, Holland, and England sought her friendship. She promoted commerce by wise legislation, and patronized the learned and literary institutions. She declined to marry her cousin, Charles Gustavus, but induced the States-General in 1649 to designate him for her successor. In 1650 she caused herself to be crowned with great pomp, and with the title of king. From that time she neglected her ancient ministers, and listened to the advice of ambitious favorites. The public treasure was squandered with extravagant profusion. Distinctions were conferred upon the undeserving, and jealousy produced murmurs, complaints, and factions. In this state of confusion the queen declared her intention of abdicating the crown. The old ministers remonstrated with so much energy that the queen desisted from her resolution. She now grasped with more firmness the reins of government, and occupied herself again with study, bought paintings, medals, manuscripts, books, maintained a correspondence with many learned men, and invited several to her court. Descartes, Grotius, Salmasius, Bochart, Huet, Chevreau, Naudé, Vossius, Conring, Meibom, appeared in Stockholm, and the queen conversed familiarly with them on literary and philosophical subjects. But new troubles occurred; and Christina, who loved whatever was uncommon, resumed her determination to resign the crown.

In 1654 she assembled the States-General at Upsal, and in their presence laid aside the insignia of royalty to surrender them into the hands of Prince Charles Gustavus. She reserved to herself a certain income, entire independence, and full power over her suite and household. A few days after she left Sweden, and went to Brussels, where she made a secret profession of the Roman Catholic religion, which she afterward publicly confirmed in Innsbruck. From here she went to Rome, which she entered on horseback in the costume of an Amazon, with great pomp. When the Pope Alexander VII. confirmed her she adopted the surname of ALESSANDRA. In 1656 she visited France, where her dress and manners produced an unfavorable impression, but her talents and knowledge were generally admired. She offered to mediate between France and Spain; but Mazarin declined the offer, and succeeded in accelerating her departure from France under various pretexts. After the death of Charles Gustavus in 1660, the queen made a visit to Sweden, under pretence of wishing to arrange her private affairs; but it was soon perceived that she had other views. As the crown-prince was very young, she declared that in case of his death she should lay claim to the throne. This project was unfavorably received and she was compelled to sign a formal act of abdication. About this time she aspired to the Polish crown, but the Poles took no notice of her wishes. Finally she returned to Rome, where she passed the remainder of her life in the cultivation of the arts and sciences, giving way at times to fits of sensual indulgence. She was interred in the Church of St. Peter, and the Pope erected a monument to her with a long inscription. She had asked only for these few words: *Viri Christina annos LXIII.*

**Christina, Maria**, queen of Spain, daughter of Francis I., king of the Two Sicilies, and mother of Isabella II., the dethroned queen of Spain: b. Naples 27 April 1806; d. Havre 22 Aug. 1878. She was married to Ferdinand VII. in 1829, and took an active part in the affairs of Spain from 1830 to 1854. As queen-regent she governed arbitrarily, and in 1854 she abdicated.

**Chris'tison, Sir Robert**, Scottish physician and toxicologist: b. Edinburgh 18 July 1797; d. 23 Jan. 1882. He was graduated in medicine at Edinburgh University in 1819, and subsequently studied in London and Paris. He was appointed to the chair of medical jurisprudence in Edinburgh in 1822, shortly after his return to Scotland, and in 1832 was promoted to those of *materia medica* and clinical medicine, but resigned them in 1877 and 1855 respectively. He was twice president of the Royal College of Physicians, president of the Royal Society of Scotland, and ordinary physician to the queen in Scotland. He was created a baronet in 1871. The most important of his published works is his 'Treatise on Poisons' (1829); but he also wrote 'Granular Degeneration of the Kidneys' (1839); and a commentary on the 'Pharmacopœias of Great Britain' (1842).

**Christmas**, the feast of Christ's birth, observed by the Christian Church annually on the 25th of December. It was, according to many authorities, not celebrated in the first centuries of the Christian Church, as the Christian usage in general was to celebrate the death of remarkable persons rather than their birth. The death of the martyr Stephen, and the massacre of the innocents at Bethlehem, had been already long celebrated, when, perhaps in opposition to the doctrine of the Manichæans respecting the birth of the Saviour, a feast was established in memory of this event in the 4th century. In the 5th century the Western Church ordered it to be celebrated forever on the day of the old Roman feast of the birth of Sol, though no certain knowledge of the day of Christ's birth existed. Among the German and Celtic tribes the winter solstice was considered an important point of the year, and they held their chief festival of Yule to commemorate the return of the burning-wheel. The holly, the mistletoe, the Yule log, and the wassail bowl relate more to paganism than to Christianity. In the East Christmas was celebrated on 6 January. As told in the Gospel of St. Luke, Christ was born during the night, and therefore divine service was performed in the night of 24-25 December, from which circumstance Christmas is called in German *Weihnachten*, a contraction of the old German *we wih nahten*, on the holy or consecrated night. The feasts of the martyr Stephen and the evangelist St. John were united with it, and a feast of three days' continuance was thus formed. In the ecclesiastical year this festival gives name to a period extending from the first Sunday of Advent to the feast of Epiphany, 6 January. In the Roman Catholic Church priests are allowed to celebrate three masses against the rule which prevails every other day in the year. In the Greek and Roman Catholic churches the manger, the holy family, etc., are sometimes represented at large. Most Christian churches celebrate this great festival in some way, and prac-

tically the entire community in Christian countries, including Jews and non-churchgoing people nominally classed with Christian populations, join in its social observance. In the United States, England, and other countries business is commonly suspended, although in Scotland this is only partially the case. The custom of making presents at Christmas is derived from an old heathen usage; but it has become consecrated by ages, and contributes greatly to make this festival an interesting event to families. The sending of Christmas cards by way of friendly greeting and remembrance has grown up within a period of some 50 years. The Christmas-tree has been traced back to the Romans. It went from Germany to Great Britain, and is almost universal in the United States, where the customs of so many nationalities meet and gradually blend into common usage.

**Christmas-box**, a box containing a present at Christmas; hence a Christmas gift. The custom of bestowing Christmas-boxes arose in the early days of the Church, when boxes were placed in the churches for the reception of offerings; these boxes were opened on Christmas Day, and their contents distributed by the priests on the morrow. In England the giving of Christmas-boxes led to the popular observance of what is called Boxing-day; that is, the first day after Christmas, when presents are made by the well-to-do to servants, messengers, and persons of humble condition.

**Christmas Carol**, a song in celebration of Christ's birth, sung especially at Christmas-time. Such carols, as well as many of a more secular but always joyous nature, have been long popular among the people of many nations. In France they are known as *noels*, and various good collections of them have been published from time to time. Consult: Sandys, 'Christmas Carols, Ancient and Modern.'

**Christmas Island**, the name given to three oceanic islands, of which the most important is situated about 250 miles south by east of the western extremity of Java. This island, which is supposed to have been originally a coral atoll, and to have been raised by volcanic forces, rises to the height of nearly 1,600 feet, and is in shape an irregular quadrilateral of about 30 miles in circumference, having an area of about 20 square miles. It was annexed by Great Britain in 1888, and a settlement has been formed on it for the purpose of developing beds of phosphate.

**Christiansund**, *kris'tē-an-sünd*, Norway, a seaport on the northwestern coast, capital of the bailiwick of Romsdal, 82 miles southwest of Trondhjem, on three islands, or rather rocks, which enclose its beautiful land-locked harbor. The trade of the place is considerable, and the town itself is fast rising into importance. The principal export is dried cod, chiefly for the Spanish and Italian markets. From its singular position there are scarcely any regular streets in Christiansund, and the communication between one part of the town and another is kept up chiefly by water. The town was founded in 1734 by Christian VI. of Denmark. Pop. (1900) 12,050.

**Christol'ogy**, that branch of the study of divinity which deals directly with the doctrine

of the person and work of Christ. See CHRISTIANITY; JESUS.

**Christophe, Henri**, òn-rē krēs-tōf, king of Haiti: b. Grenada, West Indies, 1767; d. 8 Oct. 1820. He was an African slave who received his freedom as a reward of faithful service. On the outbreak of the negro insurrection in St. Domingo, 1801, he became one of its leaders, and attracted by his energy and ability the attention of Toussaint l'Ouverture, who conferred upon him a divisional military command. After the deposition of Toussaint, Christophe served under his successor, Dessalines, and waged a war of increasing ferocity against the French, who, in 1803, were compelled to evacuate the island. In 1811 Christophe obtained undisputed possession of a portion of the island, and had himself proclaimed as Henri I., king of Haiti. His reign was that of a sanguinary despot, occasioning ultimately a successful revolt of his black subjects, whereupon he committed suicide.

**Chris'topher, Saint**, a saint whose name and worship are celebrated, but whose history is little known. He is reported to have been a native of Syria or Cilicia, who was baptized by Saint Babylas, bishop of Antioch, and received the crown of martyrdom in Asia Minor about the middle of the 3d century. Relics of him are found in several places, principally in Spain. The Eastern Church celebrates his festival on 9 May; the Western on 25 July. His intercession was particularly sought in the time of the plague. Christopher literally means "bearer of Christ." He is represented as a giant, bearing the child Jesus upon his shoulders over a stream, which refers to a legend of this saint.

**Christopher North**, pseudonym of John Wilson (q.v.).

**Christopher's, St.** (commonly called St. Kitt's), West Indies, an island of the Lesser Antilles, 100 miles northwest of Guadeloupe, discovered by Columbus in 1493. 23 miles in length, averaging about five miles in breadth, and having an area of 65 square miles. It produces sugar, potatoes, tomatoes, yams, onions, and other vegetables, as well as pineapples, bananas, custard-apples, cocoanuts, and various other fruits. Mount Misery, the highest elevation, rises 4,100 feet. The flora and fauna are similar to those of the West Indies generally, among the latter being a species of small monkey. The climate is considered to be very healthy. This island is divided into nine parishes, Basseterre being the capital. It was colonized by the English in 1623. Pop. 31,000.

**Christop'ulos Athana'sios**, Greek lyric poet: b. Kastoria, Macedonia, 1772; d. Wallachia 29 Jan. 1847. He studied medicine, and the sciences at Budapest, and finally settled at Hermannstadt in Transylvania. An epicurean in every sense of the word, and unconcerned for the fate of his country, he lived only for the gratification of his appetites and celebrated sensual indulgences in his 'Erotika and Bacchika,' or 'Love and Drinking Songs,' which have been several times collected and printed under the title of 'Lyrika.' Though partly modeled upon Anacreon and the songs of Piron, Desaugiers, and other French authors, they display so much ease and simplicity, tenderness and grace, as to give their author a high place among the poets of his nation, and entitle him to the name of the modern Anacreon.

**Christ's Hospital** (generally called the Blue-coat School, from the costume of the pupils), a school in London, founded by Edward VI., for supporting poor orphans. There used to be from 1,000 to 1,200 boys and girls at this establishment receiving instruction, board and clothing, the girls being comparatively few in number. The ages varied from 8 or 10 to 15 or 16, five of the best scholars being sent each year to Oxford and Cambridge. An entirely new scheme of management came into operation in 1891, according to which the preparatory school (established in 1683 at Hertford) has 120 pupils, the boarding-school for boys 700, and the girls' school 350; a day-school for 600 boys, and another for 400 girls, being also provided for. New hospital buildings are being erected at Horsham. Entrance to the Hospital Schools is partly by nomination or presentation, partly by competition; and in regard to two thirds of the scholars, fees ranging from £10 to £20 may be charged if the parents or relatives are judged to be able to contribute to the child's education and maintenance. Numerous exhibitions and prizes still remain, including exhibitions to the universities. The great hall at Christ's Hospital is a splendid room of great size, and remarkable for some very fine pictures. Camden, Stillington, Coleridge, Charles Lamb, and other distinguished men received their education at Christ's Hospital.

**Christ's Thorn**, a small thorny shrub of the order *Rhamnaceæ*, or buckthorn family. It is common in the southeast of Europe and Asia Minor, especially in Palestine. The fruit has a singular appearance, resembling a head with a broad-brimmed hat. The spines are long and sharp, growing on slender vine-like branches which are easily plaited, the flowers rose-shaped. The plant derives its name from its being believed by many to be the plant from which the crown of thorns was made which was placed on the head of our Saviour. The fruit is called jujube.

**Christy, Kris'ti, Charles**, American minstrel: b. New York 1828; d. Kansas City, Mo., 13 Feb. 1897. He was an actor from boyhood, supporting Forrest and Macready as well as singing on the minstrel stage. He later became a theatrical manager.

**Christy, Howard Chandler**, American illustrator: b. Morgan County, Ohio, 10 Jan. 1873. He was educated in the public schools of Duncan's Falls, Ohio; went to New York in 1893 and since then has been continuously engaged in illustrating for the leading periodicals, 'Scribner's Magazine,' and 'Harper's Magazine' especially. Several collected portfolios of his drawings have lately been published.

**Chro'mates**. See CHROMIUM.

**Chromat'ic**, in music, a succession of semitones, ascending or descending. The chromatic semitone is the interval between any given note and that same note raised by a sharp or lowered by a flat. The chromatic scale consists of 13 tones, the 8 scale tones and the 5 intermediate. It is believed by some that the term chromatic was adopted because the Greeks were in the habit of designating the intermediate tones by characters of various colors.

## CHROMATIN—CHROMIUM

**Chromatin**, krō'ma-tīn, a substance in the nucleus of a cell which is readily stained by certain reagents, such as carmine, hæmatoxylin, and safranin, so as to be distinguished from the other substance called achromatin or linin. This chromatin is made up of minute spherical or rod-like particles called "chromosomes." The latter bodies in the course of cell-division are of equal size in the same cell, and their number is the same in all the cells of all the tissues of the same species. The chromatin particles are of especial interest because they are supposed to be the bearers of heredity, and are thus supposed to form the physical basis of this unknown property of organic life. See HEREDITY.

**Chromatophore**, krō'ma-tō-fōr, a pigment cell. The possibility of change of color in the chameleon, frogs, the squid, etc., is due to certain cells in the cutis which are filled with pigment. These pigment-cells are called chromatophores, and under the stimulus of light may expand or contract. When expanded they are highly ramified, and when contracted are roundish. The pigment differs in different individuals and in different parts of the body, being yellow, brown, black, and at times even red or green. In the goby (a fish), the chromatophores, which are yellow or greenish-yellow when distended, become orange when contracted; while the orange or red ones, when shrunk, become brown or even black. In the same fish a still different kind of chromatophores are filled with iridescent crystals of marvelous delicacy, which in expansion become visible as spots of metallic sheen. It is on the distribution and different depth in the skin of the chromatophores that the pattern of markings of the skin of changeable animals depend. The common squid is very beautifully tinted, and under the microscope the chromatophores can be seen dilating and contracting, giving off a remarkable play of all the colors of the rainbow. The value of this power, which is under control, is that it gives the animal means of concealment by adapting its color to that of its surroundings.

**Chromatope**, krō'ma-trōp, or **Chromotrope**, -mō-, a toy consisting of a disk painted with arcs of circles in brilliant colors in such a manner that when the disk is revolved centrifugal or centripetal streams of color seem to flow through it. The term is also applied to an attachment for a magic lantern, by which, on the revolution of two painted disks of glass, kaleidoscopic effects are projected onto the screen.

**Chro'matype**, a photographic picture in which the paper employed has been sensitized by some of the salts of chromium.

**Chrome Green**, the green oxide or sesquioxide of chromium, forming a green pigment used by enamelers. It is also employed by dyers and calico-printers as a mordant. A hydrated variety,  $\text{Cr}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$ , used for the same purposes, is known as "Guignet's green" or "emerald green." "Arnaudon's green" contains some phosphoric acid in addition. These are now used instead of the poisonous greens prepared from arsenic as a base. See CHROMIUM.

**Chrome Iron Ore.** See CHROMITE.

**Chromic Acid.** See CHROMIUM.

**Chromite**, or **Chromic Iron**, the only important ore of the metal chromium and the source of all of the chromium salts. Chemically considered, it is a chromate of ferrous iron  $\text{FeCr}_2\text{O}_4$ , but it is usually classified by mineralogists among the oxides of the spinel group as a compound of iron protoxide, with chromium sesquioxide, having the formula  $\text{FeO} \cdot \text{Cr}_2\text{O}_3$ . The metals are often in part replaced by magnesium, aluminum, and ferric iron, as in the variety magnochromite from Silesia and mitchellite from Webster, N. C. The composition of the mineral thus approaches the chromiferous variety of spinel, picotite. Chromite has a hardness of 5.5 and a specific gravity of 4.32 to 4.57. It is usually a granular-massive, black, opaque, metallic mineral, much resembling magnetite. It has, however, a dark-brown streak and is readily distinguished from all black minerals by fusing it with borax and salt of phosphorus, the bead thus obtained assuming an emerald-green color on cooling. It is further identified by its invariable occurrence in serpentine or olivine rocks. It is often disseminated in grains, or rarely in small octahedral crystals, and thus upon the disintegration of the rock the grains are washed into the streams and adjoining bottom-lands. Prior to 1884 it was extensively mined near Baltimore, also at Texas, Pa., and in California, but the domestic production in 1902 fell to \$4,567, while ore to the value of \$582,597 was imported into the United States in 1902, chiefly from Asia Minor. The large deposits in Quebec, Yancey County, N. C., and in many other localities will no doubt be important sources of supply in the future.

**Chromium**, krō'mī-ūm (Gr. *χρῶμα*, "color," in allusion to the colors exhibited by its compounds), a metallic element discovered in 1797 by Vauquelin, in the native chromate of lead of Siberia, and afterward found combined with iron. The metal itself has never been prepared in large quantities, but it can be obtained by the reduction of the oxide by carbon in the electric furnace. It is also obtained by heating the anhydrous sesquichloride of chromium with zinc, potassium, or sodium. Chromium is extremely hard, of a grayish-white color, and less fusible than platinum. Its chemical symbol is Cr, and its atomic weight is 52.1 if  $\text{O} = 16$ , and 51.7 if  $\text{H} = 1$ . Its specific gravity is from 6.5 to 6.8, and its specific heat is about 0.1, though the latter constant has not been determined with precision. Once separated from oxygen, it does not readily combine with it again. It oxidizes superficially, however, upon being heated in air, and it decomposes steam at a red heat.

Chromium forms four different oxides, whose formulæ are respectively  $\text{CrO}$  (chromium monoxide);  $\text{Cr}_2\text{O}_3$  (chromium sesquioxide);  $\text{CrO} \cdot \text{Cr}_2\text{O}_3$  (chromo-chromic oxide); and  $\text{CrO}_2$  (chromium trioxide). Of these the first two act as bases, each yielding a series of salts with various acids. Those salts that are derived from the monoxide,  $\text{CrO}$ , are called "chromous" compounds; while those that are derived from the sesquioxide,  $\text{Cr}_2\text{O}_3$ , are called "chromic" compounds. Chromium sulphate,  $\text{Cr}_2(\text{SO}_4)_3$ , forms a series of alums with the sulphates of potassium and ammonium, the element behaving in this respect like aluminum. (See ALUM.) Chromo-chromic oxide is not chemically active. Chromium trioxide,  $\text{CrO}_3$ , dissolves in water with the formation of an acid,  $\text{H}_2\text{CrO}_4$ , which is called

## CHROMIUM — CHROMOSPHERE

"chromic acid," and is of great interest to the chemist. Chromic acid forms a series of definite salts that are known as "chromates." One of the best known of these is chromate of lead,  $\text{PbCrO}_4$ , which is used as a pigment under the name of "chrome yellow," and is formed by precipitating chromate of potassium by a soluble salt of lead. Potassium bichromate,  $\text{K}_2\text{Cr}_2\text{O}_7$ , or  $\text{K}_2\text{CrO}_4\cdot\text{CrO}_3$ , is another extremely important salt of chromic acid; it is used as a depolarizer in electric batteries, as a bleaching and oxidizing agent, and as a convenient starting-point in the manufacture of many of the chromium compounds. It possesses the peculiar property of rendering gelatine insoluble upon exposure to light, and for this reason it is used in various photographic processes.

Chromium is used to some extent in the manufacture of steel, as it is found that the addition of less than 1 per cent of chromium materially increases the strength, hardness, and elasticity of the product.

In medicine chromic acid and potassium bichromate are used. The acid is employed as a caustic; the bichromate is now rarely employed because of its irritant properties.

Poisoning by chromium compounds is similar to that caused by other metallic poisons. The drinking of battery fluid is the usual mode. There is severe gastro-enteritis, nausea, vomiting of yellowish bloody matter, diarrhoea, pain, colic, tenesmus, great prostration, muscular cramps, rapid and feeble pulse, bloody urine (perhaps suppression of this secretion), feeble and irregular breathing, with coma or convulsions preceding death. A fatal ending may occur in from 4 to 15 hours. At times this result may be delayed, and symptoms referable to degenerative processes in the liver and kidneys appear. Treatment is by prompt and continued washing of the stomach. Bismuth subnitrate is indicated in the after treatment, which is symptomatic.

**Chromium, or Chrome Steel.** See CHROMIUM.

**Chromo-lithography**, a method of producing a colored or tinted lithographic picture, by using various stones having different portions of the picture drawn upon them with inks of various colors and so arranged as to blend into a complete picture. Sometimes as many as 20 different colors are employed. It was invented by Alois Senefelder, of Prague, between 1796 and 1800. An outline drawing is first traced, and then transferred to the various stones, one for each color. The artist puts in the colors, with soap, of the tints required. Next the slab is put upon a press and carefully damped with a sponge, after which the oil color is applied with a leather roller. The parts of the slab which contain no drawing, being wet, resist the ink, while the drawing itself, being oily, repels the water while retaining the color. In printing, the lighter shades are printed off first and the darkest last. See LITHOGRAPHY.

**Chromotype** See CHROMATYPE.

**Chro'mosphere**, the gaseous envelope which exists round the body of the sun, through which the light of the photosphere, an inner envelope of incandescent matter, passes. During total eclipses it is observed that a red-colored envelope surrounds the sun, and shoots up to

great distances from the surface. It seems to have been first recognized by Secchi; and the projecting portions of it are commonly described as "red-colored protuberances" and "red flames." To this red envelope the name "chromosphere" was given by Lockyer. The light from it is much fainter than that from the photosphere; and till 1868, when M. Janssen and Mr. Lockyer almost simultaneously pointed out a method of viewing it, it was never seen except during eclipses. See SUN.

The spectrum of the chromosphere was first observed in 1868 during the Indian total eclipse, and it was found to consist of a number of bright lines, and conspicuous among them those of hydrogen. The light of the chromosphere was thus proved to be due to vast flames or masses of incandescent vapor or gas, hydrogen forming a large part of the whole.

Since the invention of the Janssen-Lockyer method of observing, as it is called, very remarkable advances have been made in our knowledge of solar physics, discoveries quite unthought-of having followed. The observations are made by means of a combined telescope and spectroscope. A spectroscope is substituted for the eye-piece of the telescope, the slit of the spectroscope being placed at the principal focus of the object-glass of the telescope. The slit is capable of being moved in such a way that any particular band of the image formed by the object-glass of the telescope may be examined by the spectroscope. The spectroscope employed for the purpose of examining the chromosphere must have the greatest possible dispersive power, and requires for this purpose a very long train of prisms.

As was mentioned above, the spectrum of the chromosphere consists of a series of bright lines. The breadth of a bright line of the spectrum is not sensibly increased by increasing the dispersive power of the spectroscope, but the contrary is the case with a continuous spectrum, which is extended by dispersion. Thus the latter becomes weakened, while the former maintain their brightness and become more visible in comparison with the others. The slit of the spectroscope being arranged so as to take in a band, either tangential or radial, close to the edge of the image of the sun formed by the object-glass of the telescope, it is found that the bright lines of the chromosphere are perfectly visible, in spite of the light of the continuous spectrum proceeding from the inner portion of the disk. Further, it has been found possible, by using a spectroscope of the very highest dispersive power, and by opening the slit sufficiently wide, to see the whole of one of the protuberances at once, and by this means to watch its motions and its changes. To understand this the reader must consult the article SPECTROSCOPE. He must recollect that a continuous spectrum consists of an enormous number of images of the slit, placed side by side, and in ordinary cases slightly overlapping each other. If we could employ an infinitely narrow slit we should have an infinite number of infinitely narrow images, and no overlapping whatever. But suppose a light to consist of only two or three colors, say light from a source capable only of giving the two bright lines C and F, that is, one in the red and another in the blue part of the spectrum. It is

## CHRONIC — CHRONICLE

easy, even with a slit of sensible width, to keep the two from overlapping, and we shall see without any confusion the two bright lines or bands at different parts of the spectrum, darkness intervening. Now imagine a flame or tongue of fire starting up from the sun's surface, and let the spectroscope be directed on its image in the telescope; there will be only portions of the slit illuminated by it, portions corresponding to the shape of the flame, and if the flame contain only light of the bright line C and F, there will be seen two images of the flame at the points of the spectrum belonging to these colors. The observations of these flames by Mr. Lockyer has furnished us with what may be considered at present as a very complete knowledge of the atmosphere of the sun, though doubtless there is yet much to be discovered by the daily observation of them that is now carried on; and the same method applied to the sun's spots has proved not less fruitful. We can give only a few of the results here, but the reader will find an account full of interest in Mr. Lockyer's papers communicated to the Royal Society, and printed in abstracts in the Royal Society's 'Proceedings' for 1869 and 1870. He will also find in the 'Proceedings' for the same date an account of the experiments of Frankland and Lockyer on gaseous spectra, undertaken with the view of determining some questions of great importance relating to phenomena observed in the course of the researches under consideration. Latterly, by methods specially devised, excellent photographs of the protuberances or flames have been obtained.

The chromosphere and its prominences, when examined with the telespectroscope (as the instrument just described is called) exhibits, as we have said, a spectrum of bright lines, due to incandescent gases. The most elevated portions consist entirely, or almost entirely, of hydrogen, the lightest of the gases. Lower down are found the gases or vapors of the heavier metals,—of sodium, magnesium, barium, iron, and others. The lower the layer of the chromosphere examined, the more dense is the spectrum filled with lines of metals, and in the prominences the red hydrogen flames tower high above all.

From minute displacements of well-known lines in the spectrum (see SPECTRUM ANALYSIS) motions are inferred of the incandescent bodies from which these lines are proceeding. On this principle motions of the fixed stars have been determined. Thus Sirius is receding from us at the rate of 20 miles per second, while Arcturus is approaching us at the rate of 50 miles per second. The principle applied to the results of the spectroscopic examination of the prominences of the chromosphere shows that they are due to enormous outbursts of gases and vapors from the sun. These gases are projected outward with extraordinary velocity, and in their neighborhood vast cyclones are observable. It is also proved by applying the same principle that the spots on the sun's surface are due to, or at least are accompanied by, vast up-rushes and down-rushes of gaseous matter.

**Chron'ic** (Gr. *χρόνος*, "time"), a term applied to diseases which are of long duration,

and mostly without fever. It is used in opposition to the term "acute," which is applied both to a pungent pain and to a disease which is attended with violent symptoms, terminates in a few days, and is attended with danger. On the other hand, a "chronic" disease is slow in its progress and not so generally dangerous.

**Chron'icle**, a history recounting in order of time all details which observation or tradition has furnished the author. It may be a universal history, or may deal with a single epoch, nation, city, or individual. Some chronicles have been preserved from early ages; the Old Testament Chronicles (q.v.) are a type of such. An important ancient chronicle, discovered on the island of Paros in 1627, and known as the 'Chronicle of Paros,' is an outline of Greek history, originally covering the period from the reign of the legendary Cecrops, king of Athens (1582 B.C.) to 264 B.C. The last part, from 355 B.C., is now lost. It omits many important political and military events, and deals more fully with the art and festivities of the people. In the early Christian ages, ecclesiastics were generally the authors of the chronicles; for example, Eusebius, bishop of Cæsarea, collected from other historical works his 'Chronicle of Ancient History.' Hieronymus of Stridon translated it into Latin in the 4th century, and other continued it. Many historical works of the Byzantine historians are also chronicles. Most of the mediæval chronicles were by monks, especially by the Benedictines, who usually began their story with the creation of the world, and gave an abridged history of the events from the first chapter of Genesis to the immediate subject of their narrative. In their statement of facts they in general knew little distinction between fabulous and true history, were not inclined to question much either visions or miracles, and were accustomed to dwell as long on unimportant as on momentous events. Chronicles are valuable for determining historical facts when, like that of Eusebius, they contain materials from older works which are now lost, or when they relate events contemporary with a writer, and of which he was a witness; and they are always valuable as an illustration of the spirit of an age and the sentiments of a people. It is through them that nearly all the history of the Middle Ages has been preserved. Every European people has numerous mediæval chronicles.

Among the German chronicles may be mentioned that of Regino, abbot of a monastery in the forest of Ardennes, whose work extends from the Christian era to 907; that of Hermannus Contractus, entitled 'A Chronicle of the Six Ages of the World,' to the year 1054; that of Lambert von Aschaffenburg, which recounts the period from the beginning of the world to 1050 in brief, and from 1050 to 1077 in detail; that of Godfrey of Viterbo, giving a universal history to the year 1186, written partly in prose and partly in verse, and entitled 'Pantheon'; and a chronicle found in the collection of Pistorius, composed by an Augustinian monk, which extends from the Christian era to 1474. These were written in Latin and, with many other Latin chronicles, were col-

## CHRONICLE OF THE KINGS OF ENGLAND — CHRONOGRAM

lected and published at Hanover in a series of volumes entitled 'Monumenta Germaniæ Historica.' The oldest historical book in the German language is a rhyming chronicle, consisting of 83,000 verses, written by Ottokar von Horneck, in the 13th century, and of nearly the same antiquity are the chronicles of Rudolf von Ems and Jansen Enekel, both having the form of poems, and furnished with notes by their authors. France is rich in chronicles, universal and particular, written in Latin, French, and various provincial dialects. It was the fancy of the earliest chroniclers to give to France a Trojan origin. Eginhard, the son-in-law of Charlemagne, chronicled the deeds and talents of that emperor in his 'History of Charlemagne.' The first of the chroniclers who wrote in the popular language of France was Geoffroi de Ville-Hardouin, who lived in the 12th century, and was an actor in the events which he describes. The 'Chronicles' of Froissart (q.v.) embrace the events occurring from 1325 to 1400 in England, Scotland, France, Spain, Brittany, and the Low Countries, setting forth in detail the feasts, spectacles, and all the pageantry, of feudal times, and enlivened throughout by Froissart's shrewd comments and observations. Of the strictly English chronicles, the earliest is that by Geoffrey of Monmouth, a monk of the 12th century, tracing the history of Britain through a series of imaginary kings, from Brutus, a son of the Trojan Æneas, who founded the British state many centuries before the Christian era, to Cadwallader, who was said to have lived 689 A.D. There is also the 'Anglo-Saxon Chronicle,' extending from the beginning of the Christian era to the death of King Stephen (see *ANGLO-SAXON LITERATURE*). The collection of chronicles edited by Holinshed in 1577 embraces a history of England to that year, a history and description of Ireland by Stanihurst, and a history of Scotland translated by Hector Boethius. 'The Chronicle of the Kings of England,' by Sir Richard Baker, published in 1643, is a history of England from Roman times to the death of King James I. It was a very popular work, and was afterward continued to the death of George I., but is now considered accurate history.

**Chronicle of the Kings of England.** See *CHRONICLE*.

**Chronicle of Paros.** See *CHRONICLE*.

**Chronicles, Books of,** the last of the historical books of the Old Testament, forming only one book in the Hebrew canon. Its arrangement after the Books of Kings, and its division into two parts, is the work of the Septuagint (q.v.). The Hebrew name means "words," or, rather, "acts of the days," and is thus much the same as our "journals" or "annals." The title given to it by the Seventy was "Paraleipomena," meaning either "remains" (of other historical works), or "things omitted." The usual and very appropriate name "Chronicles" was given to it by Jerome. According to its contents the book forms three great parts: (1) Genealogical tables interspersed with geographical, historical, and other remarks (1 Chr. i.-ix.). (2) The history of the reigns of David and Solomon (1 Chr. x.-2 Chr. ix.). (3) The history of the kingdom of Judah—excluding that of Israel—from

the separation under Rehoboam to the destruction of the Jewish state by the Chaldeans (2 Chr. x.-xxxvi.), with a notice in the last two verses of the permission granted by Cyrus to the exiles to return home and rebuild their temple. The Chronicles accordingly traverse nearly the whole field of Old Testament history, and present many points of contact with the earlier scriptures, historical and prophetic, more especially, however, with the books of Samuel and of Kings. How far the author of the Chronicles may have made use of these books cannot be determined, but that he did not solely rely upon them is evident from the number of titles of books referred to by him as authorities, sometimes on matter not contained in Samuel and Kings, or, if mentioned in them, yet with greater brevity than in the Chronicles. A considerable portion of the matter contained in the Chronicles is much the same as that in Samuel and Kings, but many particulars recorded in these books are entirely passed over, while others are more fully related in the Chronicles. A certain quantity of matter also is peculiar to the Chronicles. That these books form one of the latest compositions of the Old Testament cannot admit of doubt. Its reference, already mentioned, to the decree of Cyrus respecting the restoration is sufficient evidence of this. With regard to the author there is not the same certainty, but strong arguments can be adduced to prove that Chronicles and the Book of Ezra are by one hand, and a common opinion is that Ezra was the author of both.

Consult *Movers* 'Kritische Untersuchungen über die Biblische Chronik'; Keil, 'Apologetischer Versuch über die Chronik'; and the commentaries of the German writers, Bleek-Wellhausen, König, Wildeboer, etc.

**Chronicles of the Canongate,** a collection of Sir Walter Scott's stories published in two series. The first series (1827) contains 'The Highland Widow,' 'Two Drovers,' and 'The Surgeon's Daughter'; the second series (1828) contains 'The Fair Maid of Perth.'

**Chronicles of Clovernook,** a story by Douglas Jerrold, published in 1846. Clovernook is a "hamlet wherein fancy has loitered away a truant hour"; and under the guidance of the "Hermit of Belfyfulle" the author explores Clovernook, and discourses of it. The book charms by its quiet humor, the grace of its fancy, and the benevolence which characterizes even its satire.

**Chronicles of Froissart.** See *CHRONICLES*.

**Chronicles of the Schönberg-Cotta** (shên'-bërg kôt'tä) *Family*, a novel by Mrs. Elizabeth Charles, published in 1863. It is the story of a family during the period of the Reformation in Germany, as told chiefly by Friedrich and Else, the oldest children. The book is written with an effort after the archaic style, and has much of the simplicity and directness of the old chronicles. It is interesting and has proved a great favorite, though accurate scholarship finds fault with its history.

**Chron'ogram,** a device by which a date is given in Roman numerals by printing certain letters of an inscription larger than the others; as in a motto of a medal struck by Gustavus Adolphus in 1632: *ChristVs DVX; ergo trIVMphVs*. The value of C and the other capitals equals 1632, MDCXVVVVII.

## CHRONOGRAPH—CHRONOLOGY

**Chronograph**, krön'ō gräf, the name given to various devices for measuring and registering very minute portions of time with extreme precision. Benson's chronograph is, in principle, a lever watch with a double seconds hand, the one superimposed on the other. The outer end of the lowermost hand has a small cup filled with a black viscid fluid, with a minute hole at the bottom, while the corresponding end of the uppermost is bent down so as just to reach the hole. At the starting (say) of a horse race, the observer pulls a string, whereupon the bent end of the upper hand passes through the hole and makes a black mark on the dial, instantly rebounding. Again, as each horse passes the winning post the string is redrawn and a dot made, thus marking the time of each horse. This chronograph registers to one tenth of a second. Strange's chronograph is connected with the pendulum of an astronomical clock, which makes a mark on a sheet of paper at the beginning and end of each swing. By touching a spring on the appearance (say) of a particular star on the field of a telescope, an intermediate dot is made, and by measuring the distance of this from either of the extremes, the exact time can be ascertained to 1-100 of a second. Schultze's chronograph, in which electricity is applied, is yet far more precise, registering time to 1-500,000 part of a second.

**Chronology**, the science of dates, or of arranging events in order of time. Two steps in human progress were requisite for its existence: the invention of material records, since memory would not transmit exact sequences of events on any considerable scale; and the adoption of some recurrent astronomical period, neither too short nor too long, as a measure of time. The pictograph, developed into a system of writing, and the Peruvian quipu, or knotted cord, are the chief of the former. The fixing of the year by the Babylonian astronomers was the only feasible specimen of the latter: the month being too short for a measure of long periods, and even the year becoming too formidable in numbers for the limited counting power of the ancients. Between the creation of these raw materials, however, and the construction of a simple and universally applicable system for even one country, thousands of years elapsed in which the chaos of unsystematic systems is still the difficulty and often the despair of antiquarians.

For a satisfactory chronology there is a third requisite,—a fixed epoch to count from, no matter what: as in Babylonia the accession of Nabonassar; in Greece the hypothetical institution of the Olympian games; in Rome the imaginary foundation of the city; in Christendom the arbitrarily fixed birth of Christ; with the Mohammedans the Hegira of the Prophet, etc. But, obvious as this seems, it is in fact a very late device of civilization. Herodotus and Thucydides, in the most splendid intellectual age of Greece, wrote history without a date, or any apparent recognition that one was needed. The sequence of events was preserved; but that these need be related to an arbitrary point in the past is an artificial conception, created by the accumulation of practical inconveniences. These would seem to have differed in each country which independently invented it: the scientific and business ones in Assyria, historical in Greece, administrative in Rome. Others bor-

rowed the system when its utility was manifest; but older societies were satisfied with a ruder scheme. Their science and business was alike undeveloped; their historical sense was satisfied with a few dramatic episodes, and even the order of events was heroically confounded; and when it became necessary to keep public records, their unit was a reign, or they dispensed with units altogether and dated by some notorious event. Thus the Babylonians dated their business and official tablets "the year he brought Nannar of Nippur into a house," "the year he overran Karkhar," "the year he overran Karkhar a second time," "the year divine Bur Sin became king, etc.; on exactly the same principle as a modern mother dates events in the year the second child had the measles. Dating by the year of a certain king's reign is a natural system, still preserved in English statutes: they are not the laws of 1663 or 1860, but "4th Car. II.," "24th Victoria," etc.

In Assyria, as early as the 14th century B.C., a system was begun of dating by "eponyms," or the names of the chief officers of state, in annual succession, with the chief events in the year; each new king's name being entered on his accession. Thus: "Edsur-sarabe governor of Gozan. Revolt in city of Ashur. In month Sivan sun was eclipsed." (Three intervening entries.) "Pan-ashur-lamur governor of Arbela. Revolt in city of Gozan. Pestilence." In Rome, it was "in the consulate of" certain persons; in Athens, "in the archonship of"; and so on. Obviously, if the regular succession of functionaries is preserved for a long time, as in Assyria it was for centuries, it will furnish a perfect chronology provided one date can be fixed in the series. This has been done in several cases, and the chronology of some sections of ancient history has been accurately reconstructed over long periods. The most certain authentication is by some astronomical phenomenon whose date can be fixed by calculation; and several of these priceless data are casually mentioned by old records or historians. Thus, the mention by an Egyptian papyrus of a rising of Sirius, in connection with the overflow of the Nile, fixes the accession of Useratesen III., fifth king of the 12th dynasty, between 1876 and 1873 B.C.; the oldest certain year-date or approximate date in history yet discovered, and by a happy chance, in a country the most empty of chronological data. (The accuracy of Naram-Sin's date as near 3750 B.C. is still a battleground.) The most usual of these phenomena recorded are eclipses of the sun, from the terror inspired by the darkening of the sky; fortunately for history, as the mention of them has furnished several invaluable dates. The Assyrian eponym canon for several centuries has been fitted with accurate dates by the eclipse recorded in the first entry above, 763 B.C.; the same one is mentioned in the Bible (Amos viii. 9) as occurring in the reign of Jeroboam II. Even when we cannot be certain by itself which eclipse was meant, it is rare that other synchronisms do not fix the limit. Thus, an important date in the kingdom of Lydia is determined by an eclipse which was either 610 or 585 B.C., and other circumstances make the latter date probable.

When positive evidences fail, the only method of research is by *synchronism*, or fixing the date of an event by its connection with some

## CHRONOLOGY

other event or person of known date. Fortunately, the records afford considerable help in this, if less than could be wished: they mention international battles, captures, treaties, appeals, threats, correspondence, etc., where one date must apply to both. Noted examples of this are the biblical records as to relations of Palestine with Assyria, Egypt, Tyre, etc.: sometimes confusing events and dates, occasionally confounding persons, and needing correction from other sources, but still of extreme value. Another specimen is the Assyrian "synchronous history" of the relations between Assyria and Babylonia, a tablet of about 800 B.C. When we come down to classic times, these synchronisms are the very basis of historical work on those periods. There is also a synchronism of arts, products exchanged between countries, systems of writing, etc., and even to some extent of institutions; which, though demanding expert knowledge and careful judgment, is often of the first value. On this basis much of the Homeric and pre-Homeric history of Greece is taking shape, and even the origins of China can perhaps be related to Babylonia.

The chronological sense of different races presents extreme diversities; but it is fairly accurate to say that none of the older ones had any appreciable amount except the Babylonians, and that in them and their pupils, the Assyrians, it was early and remarkably developed. Their dated records (in the primitive fashion above) go back to the third millennium B.C. at least; the Assyrians eponym canon antedates by many centuries any similar attempt elsewhere; and the Babylonians were much the first to adopt an epoch. On the other hand, their co-founders of the earliest civilization, the Egyptians, were utterly destitute of it; and the dates in their history back of the time of close contact with Babylonia, where synchronism can be utilized, are almost pure guesswork. Beyond 2000 B.C. the divergences of estimated Egyptian dates among the most authoritative scholars vary from 500 to 1,500 years, and even down to 1500 B.C. there is often 100 or 200 years' difference; and only the vaguest inferential proof is available. The Hindus, the Chinese, the Jews, the Greeks, were nearly as devoid of chronological instinct. The case of the great Greek historians has been mentioned; and the vague Jewish "forty years," for a generation or an indefinite long time is familiar and not conducive to accurate chronology.

The obscurity due to lack of dates in general was of course enhanced by the fact that each state counted from its own events or persons, so that in place of one problem, the historical antiquary has scores. The chief method—for many ages the only one—by which this Babel of chronologies was finally reduced to uniformity over large areas was political absorption and the disuse of provincial systems. Even when fixed epochs came to be adopted, though the continuity of history was assured, the international confusion was not lessened nor comparative chronology made easier, as each selected a different epoch; and the same remedy only was operative here. Nor, indeed, for some time did even the individual system become the accurate instrument of research it is now; for the succession was not at first of years, but of annual magistrates, as with the Assyrians, Athenians, and Romans, sometimes more vaguely of kings

and priests. Moreover, with one dubious exception the date of the epoch was not that of its adoption, but centuries back; and the dates affixed by the new system to former events were often wildly fanciful, as was that of the very event which furnished the starting point. The first epoch ever used, so far as known, was the accession of Nabonassar of Babylonia 747 B.C.; it is generally believed to have been used from the beginning, but this is less probable now than formerly. The Roman era was the foundation of Rome, somewhere about 750 B.C. according to Roman writers; it is not known when it was first adopted, but probably not before the 2d century B.C. The Greek reckoning was from the alleged foundation of the Olympic games in 776 B.C., quite as apocryphal as the other; it was first used as a basis of calculation by Timæus of Sicily in the 3d century B.C. It furnishes a scientific one when the year of the Olympiad is mentioned, which is not always, so that a margin of three years is left. Note the curious fact that all three epochs begin within a quarter century or so of each other, though the last two are merely guesswork. It seems incredible that the year, apparently the most simple and obvious of natural units, was first suggested and used in 194 B.C. by Eratosthenes, the great Greek editor, mathematician, geographer, and chronographer. Of course it had been employed for thousands of years as a unit within other units, such as reigns, but not alone in sequence from a fixed epoch. The Olympiad, however, for reasons given below, held its own till the middle of the 5th century. Even after the official adoption of the Christian era,—which, like its predecessors, antedated its use by centuries,—centuries elapsed still before it was employed to the exclusion of other systems. Many other methods of dating, local or ecclesiastical, flourished beside it, and made nearly as much labor necessary in modern as in ancient times to synchronize dates. An acquaintance with these is indispensable to the study of the chronicles, charters, and other legal and Church documents of the Middle Ages.

Still another cause of the imperfection of early chronological methods was the difficulty found by the masses in grasping large numbers. Hence, it became the practice to divide the time into cycles of a small number of years, and number by the years in a cycle. The Olympiad was a refined form of this. Our own system of reckoning by centuries is another, only by its decimal form it expresses both ideas at once. Instead of saying "the 3d year of the 20th century," as "the 3d year of the 40th Olympiad," we say a term of addition, and say "nineteen hundred(s) and three." The Chaldeans had their saros of 6,585½ days, or 18 years; the Romans, their indiction of 15; and the Chinese and other Asiatic nations still use a cycle of 60. The European cycles, however, as the metonic of 19 years still used for computing Easter, were mostly used to regulate the calendar rather than to compute dates; but they are often extremely useful as an additional method of verifying these.

*Babylonian: Era of Nabonassar.*—This prince seems for a very brief time to have thrown off the Assyrian yoke and restored Babylonian independence. It was almost immediately lost; but he succeeded in imposing a new dating system which convenience main-

## CHRONOLOGY

tained, or else later gratitude looked back to him, under the glories of Nabopolassar and Nebuchadrezzar, as the pioneer of Neo-Babylonian greatness. At any rate, the era is fixed at 26 Feb. 747, from astronomical data collected in Chaldaea by Callisthenes, a general of Alexander the Great. It is the basis of the once famous Canon of Kings, or Mathematical Canon, preserved in Ptolemy's works, and previous to the era of archæology our one source of Mesopotamian history. The Alexandrian Greeks also used this era till their adoption of Julius Cæsar's reformed calendar, 25 B.C. The Babylonian year was different in length from the Julian of  $365\frac{1}{4}$  days, and the conversion of Nabonassar years into years B.C. is a matter of delicacy, necessitating a knowledge of the month and day for certainty. Tables have been drawn up for this purpose.

*Olympiads.*—It is now pretty generally admitted that the early lists of victors in the Olympic games are fictitious, and that the foundation of the games cannot be assigned a date, our first authentic knowledge beginning with the 6th century B.C.; but this is indifferent to the method of calculation which assumes a beginning in 776 B.C. They were celebrated every fourth year in the summer solstice; and as the Olympic year began sometimes with the full moon before and sometimes with the one after the solstice, to save trouble and perpetual recomputation it was reckoned as beginning the 1st of July. Hence, the Olympic years cannot be synchronized with ours year by year; the second half of the one corresponds with the first half of the other, and the month must be known for accurate conversion. Therefore, in years before Christ, when the event happened between January and June, inclusive, subtract the number of the Olympic year from 776. Thus: the oligarchy of the Four Hundred was deposed in June Ol. xcii. 1:  $4 \times 91 + 1 = 365$ ;  $776 - 365 = 411$  B.C. Socrates was executed in May Ol. xcv. 1:  $4 \times 94 + 1 = 377$ ;  $776 - 377 = 399$  B.C. If it took place in the latter part of the year (as did the immense majority of the familiar incidents in Greek history—all the great battles, for physical reasons, the deaths of Pericles and Cleon, etc.), subtract the sum as aforesaid from 777. Thus, the battle of Plataea was fought in September Ol. lxxv. 2:  $4 \times 74 + 2 = 298$ ;  $777 - 298 = 479$  B.C. If the year is after Christ, subtract the number of the Olympic year from 776 in the first case, from 777 in the second. The Olympiad was only used by historians; it is never found on coins or inscriptions. A new Olympiad was instituted by the Roman emperors, beginning with 131 A.D., and is used on some coins and inscriptions, but struck no deep root.

*Macedonian Era, or Era of the Seleucidæ:* also called by the Jews *Era of Contracts*, because their Syrian governors compelled them to use it in civil business, and styled by the writers of the Books of Maccabees the *Era of Kings*.—This epoch dates from the foundation of the Syro-Mesopotamian monarchy by Seleucus Nicator, Alexander's general; assumed to begin with his occupation of Babylon 311 B.C., 12 years after Alexander's death. It was used not only in the Seleucid empire, but by the Greek states on the east coast of the Mediterranean generally; was followed by the Jews till the 15th century, and is said to be in use by some Arabians even yet. It was the great

Eastern date for many centuries; but it is one of the most difficult to convert into terms of Christian years, from the astonishing variety in the beginnings of the year (which in different countries and among different sects varied from the vernal equinox to 28 October), and from the variation in length of year, some using the Egyptian year of 365 days, some the Julian of  $365\frac{1}{4}$ . The usual computation is to place the beginning of 312 Seleucid on 1 September in the Julian year preceding the first of our era. Therefore, to reduce a Seleucid date to ours, subtract 311 years 11 months.

*Era of Alexander.*—This is used by some Greek historians, dating from his death 323 B.C.

*Era of Tyre.*—This begins 19 Oct. 126 B.C. To reduce it to our era, subtract it from 126 if B.C., subtract 125 from it if A.D. This date is used only on medals and in the acts of some councils.

*Era of Rome.*—The date of the foundation of Rome, as related to the Olympiad epoch, is differently assigned by different authors: by Fabius Pictor at Ol. viii. 1, autumn (747 B.C.); by Polybius at Ol. vii. 2 (750); by M. Porcius Cato at Ol. vii. 1 (751); by Verrius Flaccus at Ol. vi. 4 (752); by Terentius Varro at Ol. vi. (753). As all the dates were figments, each Roman writer followed which he chose, and sometimes varied from one to another. Livy generally follows Cato, sometimes Fabius Pictor; Cicero follows Varro, as does Pliny, in general; Dionysius of Halicarnassus follows Cato. The modern writers usually follow Varro, supported by Censorinus, who specifically says the festival of the Palilia in April was the anniversary of the foundation. The Romans had two kinds of year: one for business, public or private; and the consular year, which their annalists follow. The former began with the calends of January. The latter had no fixed time of beginning, but commenced with the installation of the consuls, which happened as chance and politics dictated; it is the one generally used by the Latin and Greek historians down to the 6th century A.D., however. But in the computations of the Roman era the year begins with 21 April. After Cæsar's regulation of the calendar, the year began with January, much to the disgust of the Roman poets, who thought the spring was the real beginning, as, of course, it is.

*Cæsarean Eras.*—Several attempts were made to establish time eras from actions of Cæsar and Augustus, one of them very successful. The *Cæsarean Era of Antioch* commemorated Cæsar's victory at Pharsalia 48 B.C.; it was used by Evagrius in his 'Ecclesiastical History.' The Syrians and Greeks, however, placed its beginning 11 months apart. The Julian Era began 1 Jan. 45 B.C., and commemorated the reformation of the calendar by Cæsar. The *Era of Spain* or of the *Cæsars* commemorated the completion of the conquest of Spain by Augustus, and began 1 Jan. 40 B.C.; for many centuries it was the one era of Spain and Portugal, and generally of the Roman provinces subdued by the Visigoths, not only in the Iberian peninsula, but in southern France and in Africa. Several of the councils of Carthage, and that of Arles, also dated from this, though after the 9th century the year of the Incarnation was usually joined with it. It was not disused in Castile till 1382, and in Portugal not altogether till 1422 or later. The calendar being Julian,

## CHRONOLOGY

all its dates are reduced to ours by merely subtracting 38. There was an *Era of Actum*, commemorating that battle, fought 3 Sept. 31 B.C. The Romans began it 1 Jan. 16 Julian (30 B.C.); the Egyptians, 29 August; the Eastern Greeks (who used it till the 9th century), 2 September. The latter called it the *Era of Antioch* (not the one mentioned later), and that city struck medals with it. There was also an *Augustan Era*, beginning 27 B.C., the year in which Augustus received that title.

*Jewish Eras.*—The Jews came under foreign rule before they had invented an epoch, or even developed periodic magistrates; and their annals, except for synchronisms, are nearly as baffling as the Egyptian. Their first internal chronology is after the Macedonian era was forced on them by the Seleucid officials; their religious matters, however, were regulated by their own calendar, in which the civil and sabbatical year began (as now) about the autumnal equinox, the ecclesiastical and legal year about the spring equinox. They also made computations of the time from the Creation (see paragraph below), but their dates do not depend on it till modern times. After the Dispersion they were obliged to conform to the periods of other nations, in order to have their festivals celebrated uniformly; and they adopted a cycle of 84 years (a transformed Greek cycle). The time of its beginning is not certain, one author placing it at 162, and another at 291 B.C. In 46 B.C. the Christians adopted it, and used it partially till the Council of Nice; they then, and the Jews in 360 A.D., substituted the metonic cycle of 19 years, which the latter still employ. Till the 15th century they continued to date from the Macedonian era; since then they have adopted a Creation era, which they date 3,760 years 3 months B.C. Their dates cannot be reduced to ours without expert knowledge of their involved calendar.

*Creation Eras.*—To emphasize their separation from paganism, and avoid participation in pagan observances connected with the calendar, the Christians early began to reckon time from the supposed date of the creation of Adam according to the Jewish Scriptures. Aside from its resting only on the adding up of impossible and inconsistent genealogies, the problem was further confused by there being three texts of equal authority to work from,—Hebrew, Samaritan, and Septuagint,—all irreconcilably variant. One author collects 120 different computations of the true date; another says he has collected over 200; and 300 have been reckoned; and the estimates vary over 3,500 years, from 3,483 to 6,984 years before the Christian era. None of them have any scientific standing, but for two centuries the Christian world generally accepted as a working hypothesis Archbishop Usher's (1650) figure of 4004 B.C., which is still used in some Bible appendices and similar works. Several earlier ones, however, obtained considerable footing, and two of them are not yet disused. It is of course as useful as any other arbitrary point, like the Olympic Games or the foundation of Rome; and has the advantage of requiring only one continuous figure, in place of a break in the centre like the Christian era. But its controversial character, and the satisfaction of marking off the time after Christ's coming as the beginning of a new era, have caused the latter system to supplant it. Of

the others, the chief are: (1) *Era of Constantinople*, still employed in the Greek Church, and used by the Russians till the time of Peter the Great. This begins 5,508 years 4 months before the Christian era. The civil year begins 1 September; the Church year on the spring equinox or 1 April. To find the current year corresponding to a Constantinople year, if the event took place before 1 September, subtract 5,508 from the date; if later in the year, subtract 5,509. (2) *Era of Alexandria*. This was adopted by the Christians of Alexandria on the computation of Julius Africanus, who reckoned 5,500 years from the creation of Adam to the birth of Christ, but placed the latter three years earlier than the current reckoning, so that our era would begin 5503 Alexandrian. After the accession of Diocletian in 284, however, they dropped 10 years, both from the year since the Creation and since the Incarnation, making in fact two eras instead of one. To convert this era into our own, in the first 8 months of the year subtract 5,502 up to and including 5786 Alexandrian, after that date, 5,492; in the last 4 months, 5,503 and 5,493, respectively. This era was used by the Coptic Church till the 15th century, and is still retained in the Abyssinian. (3) *Era of Antioch*. The Syrian Christians, early in the 4th century, adopted Julius Africanus' reckoning as above, but dropped 10 years from it as the Alexandrians had already done; placing the Incarnation, however, as in our own era, three years later than the Alexandrian. As regards the Creation, therefore, the two eras are seven years apart up to Diocletian's time, and then coincide; as regards the Incarnation, the Antioch is three years less before that time and seven years later after it. Dates in this system are reduced to ours, as in the reformed Alexandrian calendar above.

*Era of Diocletian, subsequently named Era of Martyrs.*—At the same time that the Alexandrians changed their Creation era as above, they established a new and shorter one from the accession of Diocletian, 29 August (first of the Egyptian year) 284. The second name given implies that an attempt was made to start it from 303, the date of Diocletian's edict of persecution, but if so it was unsuccessful, as indeed a mere perpetuation of a strife was likely to be. The era is still used by the Copts of Egypt and the Abyssinians. The change from the Egyptian to the Julian calendar, and the peculiar complications it has introduced into the conversion from that era to ours, are too intricate to detail here. To make the change, add to their date 283 years 240 days in common years; if the date is between 30 August and the end of the year in the one before leap year, add 283 years 241 days. But the Ethiopians do not reckon the years continuously from the beginning: at the end of each 532 years (that is,  $28 \times 19$ , or the solar and lunar cycles multiplied together) they begin again with 1.

*The Christian Era.*—It is not generally realized how modern this epoch is in general use. It was introduced into Italy 533 A.D. by Dionysius Exiguus ("the lean"), a Roman abbot; was not introduced into Gaul (France) till the 8th, and not in current use there till the 9th; and came into use in England only in the latter part of the 8th. In Latin countries the current scheme before that was the cycle of indiction (below). Any uniform date is so useful that

## CHRONOMETER

its defects may be overlooked. That of having a double set of numbers, forward and back, is not serious. Perhaps the chief inconvenience in calculating backward is that of calling the year preceding the era 1 B.C. instead of 0; thereby making the leap years on the backward series fall on the odd years, 1, 5, etc., or else making 7 years between the first one previous and the first one after. Astronomers rectify this by calling the first year previous 0. For the different dates on which the beginning of the year has been placed, see *CALENDAR*. DIONYSIUS fixed the birth of Christ in 754 of the Roman Era, but he began the year 1 with the Annunciation, 25 March of the year preceding. In ecclesiastical and common usage it has begun at Christmas, Easter, 1 March, and other dates. In England from the 7th to the 13th century it was on Christmas; in the 12th the Annunciation began to be used as well, and from the 13th till 1752 remained paramount. The different beginnings of the year must be carefully taken into account in studying mediæval history.

*Cycle of Indiction.*—This was a period of 15 years, whose object has been already explained. It was generally used in the Western or Latin empire for several centuries before the Christian Era became general. It began in the year 313, or was referred to that year as a start. There were three, differing only as to the beginning of the year: (1) The Constantinopolitan, beginning in September, like the Greek year; generally used in the Eastern or Greek empire, and sometimes in France. (2) The Imperial or Constantinian, attributed to Constantine the Great, called also the Cæsarean. It began 24 September, and was used by old French and English chroniclers. (3) The Roman or Pontifical, beginning on Christmas or 1 January as custom varied; often used in papal bulls, and sometimes in old French writers. To find the number of any year in the Indiction, add 3 to the date (our era), divide by 15, and the remainder is the number. If the remainder is 0, the year is the fifteenth or last of the cycle.

*Armenian Era.*—This starts from the Council of Tiber, 9 July 552, when the Armenian schism began by condemnation of the acts of the Council of Chalcedon. The Armenian civil year is the Egyptian year of 365 days, out of all measure with others; their ecclesiastical year begins 11 August, and has the Julian calendar. They also use the Creation Era of Constantinople along with their own, dating documents with both on occasion. In business with Europeans they employ our era and our year. To convert their civil dates to our era, multiply the number of Armenian years by 365; add the number of days from 1 January to the given date; subtract 176; the remainder will be the number of days from 1 Jan. 553 to the given date; reduce this to Julian years, add 552, and this gives the date in the Julian year, old style. Add the requisite number in the Gregorian calendar if desired. In ecclesiastical reckonings, add 551 years 223 days. In leap years, if the date is between 1 March and 10 August, subtract one day from the above.

*Mohammedan Era.*—This commemorates the Hijra or Hegira (flight) of the Prophet from Mecca to Medina, 622 A.D. It does not, however, date from the flight, but from 68 days previous, 10 July, or as some have it, 15 July. The methods of computation are too complicated and uncertain to be given here: Mohammedan chrono-

nology is one of the most treacherous of subjects, and even experts disagree and go astray.

*Persian or Gelalaan Era.*—This begins with the accession of Yezdegird III. to the throne of Persia, 16 June 632. Till 1079 the Persian had the random Egyptian year, 365 days without intercalation; it was then reformed by Omar Khayyam, the great poet and astronomer, under Malek Shah, to a degree almost as accurate as the Gregorian. There were seven successive leap years once in four years, but the eighth was deferred till the fifth year. This method was once universal in Persia, and is still followed by the Parsees of India. Owing to the days of error accumulated by the old year, the day of beginning is thrown back, so that the Persian year can be converted into ours by adding 631.

*Hindu Eras.*—The philosophers divided the duration of the world into four *yugs* or ages, of which three are past, and the present corrupt one, the *kali-yug*, is alone historical. It begins 3101 B.C. and includes several others in use. The Era of Vikramaditya, from a Hindu Augustus who may or may not be historical, is reckoned from 57 B.C. This monarch is generally attributed to the 5th or 6th century if real, and the epoch is thought a sidereal one. The Era of Salivahana is 78 A.D. This is used in southern India, and commemorates an equally dubious ruler. The Fusli Era, used in revenue transactions all over India, is not uniform, but the most usual begins 590 A.D.; it seems to be a Mohammedan one, and to correspond roughly to the Hegira. The Bengali Era is another of the sort, and is set at 631. There are also others which are used in different provinces. The 60-year cycle is employed, its date being variously set.

*Chinese Chronology.*—This rests on cycles of 60 years, the mathematical tribunal fixing their start at 2277 B.C. But since 163 B.C. the Chinese writers have used periods called Nien-hao, each beginning with the accession of some emperor, and named after him, as with English laws, and ending when he or some successor chooses to begin a new period. Tables of Nien-hao are therefore needed to identify the years.

FORREST MORGAN,

*Connecticut Historical Society.*

**Chronom'eter** (Gr. *χρόνος*, "time" + *μέτρον*, "measure" = "time-measurer"), an instrument designed to measure time with great accuracy, and much used in scientific work and for the determination of longitude at sea. The marine chronometer bears a strong superficial resemblance to a watch, except that it is larger and is mounted upon gimbals, so that the motion of the ship may affect it as little as possible. In its mechanism it differs from a watch chiefly in the design of its escapement and balance-wheel. The usual form of escapement, as invented by Le Roy about 1765 and greatly improved by Earnshaw and Arnold some 15 years later, is shown in Fig. 1.

In the ordinary watch the balance-wheel is in connection with the train of wheels leading from the mainspring continuously, or nearly so; but in the chronometer it is free from these during the greater part of the time, so that its natural period of vibration is more nearly realized. A is the escape-wheel, which is in gear with the other wheels of the instrument and is prevented from free rotation by means of the locking-pallet, D. B is a disk (technically

## CHRONOMETER

known as the "impulse-roller") secured to the same staff, or axis, as the balance-wheel. F is the "detent spring," which serves to return the light frame, G, and the locking-pallet, D, to the position they have in the illustration, after the detent has been tripped by the balance-wheel. A set screw is provided for preventing the locking-pallet, D, from being drawn too far into the escape-wheel, but this has been omitted in the illustration for the sake of greater clearness.

When the mechanism is in the state shown, the balance-spring should be free from strain; but the balance-wheel is moving with its maximum velocity in the direction (let it be supposed) of the arrow, so that in another instant the discharging-pallet, H, will trip the detent by momentarily withdrawing the locking-pallet, D. The escape-wheel, A, is then free to rotate until again arrested by the locking-pallet, D; but as it does so it engages the impulse-pallet, C, and accelerates the balance-wheel. After the escape-wheel has been arrested by the locking-pallet, the balance-wheel continues its excursion until the energy of its motion has all been expended in winding up the balance-spring. The balance-spring then preponderates, and the wheel returns to the opposite extreme of its swing without disturbing the locking-pallet, D; the discharging-pallet, H, merely raising the light gold spring, E, as it passes the detent. In most chronometers the balance-spring is made in the form of a helix instead of a flat spiral.

The balance-wheel is also compensated for change of temperature, though this feature can hardly be said to constitute a point of difference between a chronometer and a watch, since practically all of the better grades of watches are now similarly compensated. The effect of an increase of temperature upon the rate of a chronometer (or watch) is of a dual nature. If the instrument keeps correct time at one temperature, then, unless some mode of compensation is provided, it will lose time at all higher

FIG. 1.—Chronometer Escapement.

temperatures, because (1) the strength of the balance-spring is less at higher temperatures, and (2) the wheel itself is greater in diameter on account of its natural expansion, so that it has a greater moment of inertia, and hence responds more sluggishly to the action of the balance-spring. To counteract these effects as far as possible, certain weights are provided along the rim of the wheel and the wheel is so designed that as the temperature rises these weights are automatically thrown nearer to the axis of rotation. The moment of inertia of the wheel is thereby reduced, and the wheel is

caused to respond to the weakened spring with precisely the same readiness as before. The essential parts of the balance-wheel of a marine chronometer are shown in Fig. 2. The rim is

FIG. 2.—Balance Wheel of Marine Chronometer.

divided by transverse cuts into two equal, semi-circular segments, each of which is supported near one end; and it is built up of two concentric metal strips, of which the inner is steel, while the outer (which is twice as thick) is of brass. As the temperature rises the brass expands more than the steel, so that the rim-segments are deflected inward, and the weights, AA, are caused to approach the axis (or "staff") of the wheel. The two masses AA must always be opposite one another, in order that the balance may not be thrown out of poise; but they are slotted so that they may be slid along the rim. If a chronometer keeps correct time at one temperature, but loses at a higher temperature, the compensation is not sufficient, and the masses AA must be shifted toward the free ends of the rim-segments. If it gains at the higher temperature it is over-compensated, and the masses AA must be shifted toward the fixed ends of the rim-segments. In practice it is found to be impossible to adjust the masses so that the instrument shall be perfectly compensated at all temperatures. In fact, the theory of the balance shows that there are only two temperatures at which the chronometer can be expected to keep correct time, though these two may be selected arbitrarily, and the instrument adjusted accordingly. In marine chronometers the temperatures so selected are usually 45° and 90° F., and at intermediate temperatures the instruments will gain. Hartnup, the director of the Liverpool Observatory, concluded, as the result of experiments upon 1,000 chronometers, that the error in rate from imperfect compensation may amount to 1.5 seconds per 24 hours at temperatures 15° F. above or below either of the points at which the balance is standardized, when the balance-spring is of steel. With palladium springs the error is smaller. When the

## CHRONOSCOPE — CHRYSANTHEMUM

balance has been compensated for temperature as accurately as possible, the moment of inertia of the wheel is adjusted so that the chronometer will keep correct time at the standard temperatures, by means of the slotted nuts BB. These turn upon screw-threads that are secured to the rim near the central arm, where their positions will not be sensibly affected by changes of temperature. If they are caused to approach the rim, the moment of inertia of the wheel is lessened, and the chronometer runs faster; and *vice-versa*. The slots in BB are provided so that the nuts may grasp their screws spring-tight, and so avoid backlash. (For full information on these matters and many others connected with time-pieces, consult F. J. Britten's 'Watch and Clockmakers' Handbook.')

**Chronoscope**, krōn'ō-skōp, an ingenious instrument, due to Sir Charles Wheatstone, for the purpose of estimating the duration of certain luminous phenomena, such as the electric spark, which according to ordinary means of measurement, appear absolutely instantaneous. It is founded on what is known as persistence of the impression on the retina of the eye. When a burning stick is whirled rapidly through the air a line of light is seen, the impression that the eye receives from the bright point in one position remaining long after the point has moved to a new position. Wheatstone views the electric spark in a small steel mirror revolving with enormous, but measured, velocity, and having a motion arranged, so that, were the light permanent, the object would appear to describe a complete circle. If then the phenomenon be instantaneous, a mere point of the circle will be seen, but if it have a duration shorter than the time of a revolution of the mirror, but still not infinitely short, the image will stretch out into an arc of the circle proportionate in length to the duration. The principle has been employed to show the discontinuity of certain flames which from persistence of vision appear continuous. These, when viewed in a mirror revolving rapidly, appear as a number of points or streaks of light arranged at intervals along the circle.

**Chrosperma**, krō-spér'ma, a monotypic genus of plants of the natural order *Melanthaceae*; the bunch-flower. The single species (*Muscatoxicum*) is commonly known as fly-poison, so called from its deadly effect on flies and similar insects. It abounds in dry sheltered soil from Arkansas and Tennessee eastward along the seaboard of the United States, in some sections reaching high altitudes.

**Chrudim**, hroo'dēm, Austro-Hungary, a town and capital of a circle of the same name of Bohemia, situated 62 miles southeast of Prague on the river Chrudinka. It is a walled town and contains an old church and a Capuchin convent. It has manufactures of cloth; and the horse markets held here are the most important in the empire. Pop. 13,000.

**Chrysal** (krīs'al) or the Adventures of a Guinea, a satirical novel by Charles Johnstone, published in 1760. Chrysal, the spirit inhabiting a guinea, passes through many hands, from the prince's to the beggar's, and tells its own story, which is chiefly the adventures of those in whose possession it is for the time being.

**Chrysalis**, krīs'a-līs, the pupa stage in butterflies, succeeding the caterpillar. During this time the insect eats no food, living upon the fat stored up by the larva. (See PUPA.) The chrysalids of butterflies differ from the pupæ of moths in being often ornamented with brilliant golden spots which have given origin to the name "chrysalis" or "aurelia." Also the body is often strengthened or protected by tubercles situated on the head, back, and sides. They are either suspended head downward by the tail, or rest horizontally, with a thread passing around them to hold them securely. Many, if not most, chrysalids are protected from observation by their colors, which harmonize with the color of the object to which they are attached. Thus, the chrysalis of the milkweed butterfly (*Anosia archippus*) which is suspended among the pale-green leaves of the milkweed and does not hibernate, is of a pale-green tint; while those of *Papilio turnus*, or of *Pieris*, are gray, and so spotted with light and dark marks as to harmonize with the neutral tints of the boards or fence to which they are attached. These colors and markings are apparently due to the effects of light and shade. These tints are determined at the period when the caterpillar is about to pupate, or become a chrysalis, when the integument is soft and moist. Poulton found, by subjecting the partly formed chrysalis to artificial surroundings of different colors, that the breeding boxes, when lined with black paper, produced dark chrysalids; when lined with white, light-colored, or green ones, or when lined with gilt, they produced chrysalids of a distinctly golden color, more completely so than occurs in nature.

Certain chrysalids have been found to exhibit negative phototropism (q.v.); that is, are directly sensitive to light. They will, while suspended by the tail, change their position if sunlight strikes them, and move so as to keep in the shade, from a pendant to a horizontal position, through an angle varying in different species of from 45° to 70° or even 90°. Too much light, especially direct sunlight, seems to be injurious to them, and the movement is one of protection.

**Chrysanthemum**, krī-săn'the-mūm, a genus of herbs and sub-shrubs of the natural order *Compositae*. The very numerous species are natives mostly of the cooler parts of the northern hemisphere, but some have become introduced and established in the southern hemisphere as weeds, having escaped from gardens. They are generally hardy, white or yellow-flowered, annual or perennial, and of easy cultivation. Except *C. cinerariaefolium* and *C. coccineum*, the flowers of which are used to make insect powder (q.v.), the species have small economic use, though some, notably *C. leucanthemum*, the ox-eye daisy, is a troublesome weed upon badly managed land in the United States. *C. segetum*, the corn-marigold, and *C. frutescens*, the marguerite, are cultivated for ornament, especially in Europe, where they are native.

But the most important species are *C. indicum* and *C. morifolium* (*C. sinense* of some botanists). These are the parents of the popular autumn flowers known as "mums" and chrysanthemums, the varieties of which in Europe and America are numbered by thousands, and vary greatly in size, form, and color. So great is the

CHRYSANTHEMUM

diversity that fanciers speak of the varieties as belonging to certain types, of which 11 are recognized: Single, double, large, small, few-flowered, many-flowered, anemone-flowered, and various forms of the ray flowers, such as incurved, reflexed, etc. The size ranges from the "pompon," which may be less than an inch in diameter, to the "show," which may exceed eight inches in diameter. But with all this range of form and color the varieties are almost scentless, or have a somewhat disagreeable odor. These varieties are mainly cultivated under glass, since they do not reach perfection in the open air. They are propagated almost wholly from cuttings, which are taken from the parent plant after it has flowered. The cuttings are grown in a cool greenhouse until spring, when the young plants, then in pots, are placed in partial shade for the summer and kept as stocky as possible. In autumn they are forwarded until they blossom, after which they are destroyed, new cuttings having been taken.

For exhibition purposes the plants are watched and tended with the most minute attention, the superfluous buds and stems being removed while still tiny. Sandy or clayey soil is found useful by various growers, but whatever its character it must be rich and rather porous. Attention to fertilization, watering and cultivation are essential. For out-door culture the large-flowered varieties are unsuited, but the hardy pompons, which are usually free-flowering, are more satisfactory. Though the season of the indoor chrysanthemum is only about six weeks long, this flower ranks fourth in importance in the United States as a commercial flower, about \$500,000 worth being used annually.

The literature dealing with this flower is voluminous, probably ranking next in extent to that dealing with the rose. Eighty-three books are listed by C. Harman Payne in the 'Catalogue' of the National Chrysanthemum Society (1896). Other references to literature are given under the title *Chrysanthemum* in Bailey's 'Cyclopedia of American Horticulture,' which should be consulted for descriptions of various species, types, etc., and for methods of propagation, cultivation, and management. Consult also: Scott, 'The Show Chrysanthemum and Its Cultivation'; and Bulletins 112, 136, and 147 (1896-8), of the Cornell University Agricultural Experiment Station.

**Chrysarobin**, krī-sā'rō-bin, a neutral principle extracted from goa-powder, a substance found deposited in the heart wood of *Vouacapa araroba*. It is an extremely irritating substance and is not used internally. Externally, combined with an ointment base, it is useful in a number of chronic skin affections.

**Chryseis**, the daughter of Chryses, a priest of Apollo. She was captured by the Greeks in the Trojan war, and became the portion of Agamemnon. When he refused to restore the daughter at the request of her father, Apollo listened to the prayer of his priest, and sent by his arrows pestilence and death into the Greek camp. Agamemnon found himself obliged to yield up the maiden, but then robbed Achilles of the fair Briseis. Hence arose the dissension between these heroes which so long delayed the conquest of Troy, and with which the story of the Iliad opens.

**Chryselephantine**, krīs'ēl-ē-fān'tin, in Greek art, statues which were overlaid with ivory and gold. The frame or body of the statue upon which the ivory plates were fastened was usually of wood, and the gold was used for the garments and hair. The most celebrated of these statues were the colossal works of Phidias, of which the largest was the Pallas of the Parthenon, 26 cubits high, representing the goddess in armor covered with a long robe.

**Chryses**, a name appearing several times in Grecian legend: (1) a priest of Apollo, who, according to Homer, came to the Grecian camp to ransom his daughter Chryseis, who had become the prize of Agamemnon. (2) The son of Neptune and Chrysogeneia, and the father of Minyas. (3) Was the son of Minos and the nymph Pareia. He lived on the island of Paros with his brothers Eurymedon, Napholeon, and Philolaus, and was put to death by Hercules because he had, in concert with them, murdered two of his companions. (4) A son borne by Chryseis to Agamemnon after her return to her father, but alleged by her to be the son of Apollo. He assisted his step-brother and step-sister, Orestes and Iphigenia, in murdering King Thoas.

**Chrysippus**, Greek Stoic philosopher of Cilicia: d. about 206 B.C. He was distinguished for his skill in disputing. He was the principal opponent of the Epicureans, and is said to have written 700 different works, mostly of a dialectical character; but of these no complete work is extant. He died at a great age.

**Chrysis**, a priestess of Juno, who by falling asleep suffered the sacred fire to destroy the temple of her goddess, and was at last burned herself.

**Chrysobalanæ**, krīs-ō-bāl'a-nae, a plant family closely allied to the *Rosaceæ*, of which it is sometimes considered a sub-order, comprising 12 genera, with 180 species, all trees or shrubs. Many of them, as the cocoa-plum, produce edible fruits. So do several species of west Africa, the seeds of which are sometimes substituted for or used to adulterate sweet almonds, which they resemble in taste and appearance. From the seeds of a member of the family growing in the Himalayas an oil is extracted.

**Chrysoberyl**, krīs-ō-bēr'il (Gr. χρυσόβηρυλλος, "golden beryl"), a native aluminate of glucinum (or beryllium), having the formula  $\text{GlO} \cdot \text{Al}_2\text{O}_3$ , and crystallizing in the orthorhombic system. It is transparent or translucent, with a vitreous lustre and a green or yellow color. The variety alexandrite (q.v.) is green by daylight and columbine-red by artificial light. The finer varieties are used as gems. It has a hardness of 8.5 and a specific gravity of from 3.5 to 3.84. Chrysoberyl occurs in Brazil, in Ceylon, in the Urals, and in Ireland; and in the United States it has been found in Maine, Connecticut, and New York. See also CAT'S-EYE.

**Chrysocola**, krīs-ō-kōl'la, a hydrated silicate of copper, having the formula  $\text{CuSiO}_3 + 2\text{H}_2\text{O}$ . It is cryptocrystalline and usually occurs in opal-like or earthy masses, or as incrustations, or not infrequently with botryoidal surface. When pure it is translucent and of sky-blue color, but when impure it is often opaque and dull green, brown or black. Its hardness varies

with its composition, from 2 to 4, and its specific gravity from 2 to 2.2. Its lustre varies from vitreous and shining in the pure mineral to dull and earthy. It is found in copper mines in all parts of the world, especially in Cornwall, England, Australia, and Arizona. The chryso-colla of the ancients, meaning "gold glue," was apparently a body used to facilitate soldering. The name is still applied to borax which is thus used. Malachite, the green carbonate of copper, was doubtless confused with chrysocolla.

**Chrysogonum**, *krīs-ō-gō'nūm*, a monotypic genus of the natural order *Compositæ*. It is found throughout the eastern seaboard of the United States, in dry soil, from southern Pennsylvania to Florida, blossoming in April and July. It is a perennial herb with large heads of tubular and radiate flowers.

**Chrysolite**, *krīs-ō-lit* (Gr. *κρυσόλιθος* "bright yellow stone"), a native silicate magnesium and iron, sometimes also containing titanium, nickel, or tin. It occurs massive and granular, and also in orthorhombic crystals. It is transparent or translucent, and usually green or yellow in color, with a vitreous lustre. It has a specific gravity of from 3.27 to 3.57 (according to its composition), and a hardness of from 6.5 to 7. Chrysolite occurs in volcanic rocks, as in basalt and basaltic lavas, and it is also found in dolomite and in certain varieties of limestone. The finest crystals of the mineral come from Brazil and Egypt, and are known as "precious chrysolite." They are used to a certain extent as gems, and are sometimes confused with the emerald. Chrysolite readily passes by alteration into serpentine, and numerous large beds of the latter mineral are known to have originated in this manner. It is abundant in crystalline grains in some meteoric irons and stones. Peridot and olivine (qqv) are names frequently used for varieties of chrysolite.

**Chrysoloras**, **Manuel**, Greek scholar: b. about 1355; d. Constance, Germany, 15 April 1415. He was the first who, in modern times, transplanted Greek literature into Italy. The Emperor John Palæologus sent him in 1391 to Italy and England to ask for assistance against the Turks. Having thus become known in Italy he returned there about the year 1395, and was appointed professor of Greek literature at Florence, where he collected around him a great number of scholars of all ages and ranks, and excited universal enthusiasm as much by his dignity and the grace of his elocution as by the extent of his learning. From his school proceeded Leonardo Bruno, Poggius, Francis Philiphus, and other distinguished revivers of classical studies. He afterward taught with equal success at Milan, also at Pavia and Venice, and lastly at Rome. Pope Gregory XII. employed him in public affairs, and sent him with others to the Council of Constance, where he died in 1415. He should not be confounded with his nephew and companion in Italy, John Chrysoloras.

**Chrysomelidæ**, *krīs-ō-měl'i-dē*, an extensive family of small beetles which have a hemispherical or ovate form, small, sunken head, and antennæ widely separated. All, and especially the typical genus *Chrysomela*, are very gaily colored.—blue, green, golden, or a mixture of brilliant tints. The most elegant American spe-

cies (*C. scalaris*) has the head, thorax, and under side dark green, while the wing-covers are silvery white, ornamented with small green spots on the sides and a broad irregular stripe down the middle of the back; the legs and antennæ are rust-red, and the wings rose-colored. These beetles inhabit trees, bushes, and plants, feeding, in their larval state, on the leaves. They include many species, as the potato-bug and the elm-leaf beetle, which do vast damage. Their eggs are laid on the leaves, and the grubs, which as a rule are protected by disagreeable odors and exudations, go into the ground to transform, and there spend their pupal life. The family is a very large one and is spread all over the world. See LEAF-BEETLES.

**Chrysophanic** (*krīs-ō-fän'ik*) **Acid**, the yellow coloring matter of rhubarb. It can be obtained direct from rhubarb by exhausting with benzol and purifying the crude product. It crystallizes in fine yellow tables. It is hardly soluble in water, but dissolves in ether, benzol, etc. With potash it gives a fine purple solution, and thus affords a delicate test for the presence of alkalis. It is also soluble, without decomposition, in strong sulphuric acid. Its acid properties are rather obscure.

**Chrysophyllum**, *krīs-ō-fil'ūm*, a genus of the sapadillo family (*Sapotacæ*), consisting of trees with milky juice, alternate leaves with numerous transverse closely aggregated ribs, and golden hairs on the under surface. In the West Indies the fruit (*camuto*) is esteemed a delicacy under the name of star-apple, which is fleshy, with several one-sided cells, or by abortion, with one. Seeds nut-like. Natives chiefly of southern United States, Africa, and India.

**Chrysopræse**, *krīs-ō-præz*, a variety of chalcidony, colored apple-green by nickel oxide and prized as a semi-precious stone. It became popular a few years ago because of Queen Victoria's fondness for it. Silesia and Siberia long furnished a small supply, but recent discoveries in California have made it abundant and cheap. It also occurs in Oregon and North Carolina.

**Chrysopsis**, *krī-sōp'sis* (from the Greek, signifying "of a golden aspect"), a genus of about 20 species of the natural order *Compositæ*, comprising nearly 30 species, natives of North America and Mexico. Commonly known as the golden aster.

**Chrysostom**, **Dion** (surnamed *Cocceianus*), Greek orator: b. Prusa in Bithynia about 99 A.D. He was first a Sophist, then a Stoic, and rose into high repute as an orator under Domitian. That tyrant, however, took offense at his freedom of speech, and he was obliged to save himself by flight. He was afterward highly esteemed by Nerva and Trajan. About 80 of his orations are still extant. They are written in an affected style, but notwithstanding form a valuable contribution to our knowledge of ancient philosophy. They appeared first in a collected form at Milan in 1476.

**Chrysostom**, *krīs-ōs-tōm* or *krīs-ōs'tōm*, **John**, **Saint**, archbishop of Constantinople, greatest of the Greek Fathers of the Church: b. Antioch, the capital of Syria, about 347. His cognomen, the golden-mouthed (*chrysostomos*), he owes to his extraordinarily rich, fervid, and persuasive eloquence. In his youth

## CHRYSTLE — CHRYSTLER'S FARM

he attended the school of Libanius, a celebrated Pagan sophist, was his favorite disciple, and would have been his successor had he not been won for the service of the Church by his pious mother Anthusa. In accordance with the general usage of that time, he did not receive baptism till he had attained maturity, and then he lived devoted in religious contemplation and studious seclusion in a desert place for six years. There the austerities he practised undermined his strength, and being called back to Antioch by the bishop, he was ordained deacon in 381 and presbyter in 386. By his zeal, his urbanity, and his eloquence, he won to the Church, heretics, pagans, and Jews in great numbers; and his fame spreading to the capital city of the Eastern empire, he was, with the approval of the Emperor Arcadius chosen to be archbishop of Constantinople in 397. Here he led in the episcopal palace the life of an ascetic, eschewing the pomp and luxury of his predecessors, and out of the revenues of the see maintained numerous charities. Meanwhile his homilies or pulpit discourses, which are still extant, were even a stronger attraction for the masses than the shows of the amphitheatre. But he had many rivals, who left no means untried to blacken his character, his reputation for piety, zeal, disinterestedness, and for orthodoxy, and his life was accordingly full of trials and vicissitudes. His enforcement of the Church's laws regarding the relations between ecclesiastics and the female inmates of their households; his deposition of bishops for simony and licentiousness; the restraints he put upon the vagrant habits of the monks, called forth a host of enemies, who brought against him the charge of sympathizing with heretical monks of the Nubian desert who had been excommunicated by their ecclesiastical superior, Theophilus, patriarch of Alexandria. Theophilus now added himself to the malcontents of Constantinople, and he called a synod of bishops to be held in the imperial city to judge Chrysostom. But because of the menacing attitude of the common people, who were to a man loyal to their archbishop, the synod had to be held in the neighboring city of Chalcedon. To this synod Chrysostom was four times summoned, to reply to the charges that were to be made against him, but he ignored the summons, and was declared guilty of favoring the heresies of Origen. By order of the emperor Arcadius he was exiled to Nicæa in Bithynia; but so great was the commotion of the common people in Constantinople when the decree of banishment was published, that the emperor, alarmed, ordered his recall. The re-entry of Chrysostom to the city was attended with all the pomp of a Roman triumphal procession, and he abated no jot of his zeal for the repression of the evils of Church and state. His language was, as it had ever been, sufficiently emphatic, sufficiently plain-spoken, but his enemies put in circulation a spurious version of the opening passage of his first discourse after his return: he was reported by them to have commenced his address with these words in denunciation of the empress Eudoxia: "Herodias is again furious; Herodias again dances; she once more demands the head of John." The report was false, but the fate of Chrysostom was sealed. Barbarian troops were

brought into the city to overawe the commons while another synod was in session in the city: it confirmed the decree of the synod of Chalcedon. By decree of the emperor, Chrysostom was banished to Cucusus, a place in Mt. Taurus. The people of Constantinople, not to be restrained by the garrison of Gothic mercenaries in the city, set fire to the cathedral and the senate house on the day the decree was published; and Chrysostom, though absent, was a more formidable power than ever: his correspondence with bishops, both in the East and West arrayed the whole Catholic Church against Theophilus and the court of Arcadius. Indignant at the contumacy of the exiled archbishop, Arcadius ordered his transfer to a more inhospitable region still, the desert of Pityos: he died on the way thither at Comana, in Pontus, 14 Sept. 407, being then in his 60th year. His day in the calendar of the Greek Church is 13 November; in that of the Latin Church, 27 January. His last words are reported to have been "God be in all things praised." His works that are still extant are very voluminous, and they fully justify the high repute he enjoyed, both as an orator and an expounder of the Scripture books and of points of doctrine. They consist of homilies or discourses suggested by or illustrating passages of Scripture; commentaries on the sacred books; epistles, and treatises on the truths of religion, virtues and vices, etc.

**Chrysotile**, kris'-ō-til, a variety of the mineral serpentine, occurring in silky fibres that are flexible and easily separated. It is commonly greenish in color. Its specific gravity is about 2.22, which is sensibly less than that of ordinary serpentine. It occurs abundantly in Canada, where it is known as "bostonite" and "asbestos." See ASBESTOS.

**Chrystler's Farm, Battle of**, the most discreditable American defeat, as Chippewa was the most brilliant victory, of the War of 1812, was fought 11 Nov. 1813. The expedition prepared in the summer and fall of 1813 at Sackett's Harbor, on Lake Ontario, to descend the St. Lawrence and capture Montreal, started 17 October under bad auspices. Aside from insufficient resources and the lateness of the season, the personnel was hopeless. The commander-in-chief alone would have ruined it. This was Maj.-Gen. James Wilkinson, termed by Scott, "an unprincipled imbecile," a mere cunning jobber, of neither military talent, firmness, nor even character to be respected, and despised by all the other officers. He had been appointed for the curious reason that New Orleans was not thought safe in his hands. Furthermore, he was prostrated with lake fever, as was his second in command, Morgan Lewis. Boyd, the third, was so incompetent that Jacob Brown, the one able fighting general, had threatened to leave the army rather than serve under him. Men cannot fight without leaders. The flotilla, battered by contrary winds, began the descent of the river 5 November. From this on, the British made progress slow and dangerous. Capt. Mulcaster, an able and daring naval officer, with several gunboats, harassed the rear, and 800 regular infantry co-operated with him, pouring musketry and artillery fire on the expedition from the opposite bank whenever possible, besides the batteries at Prescott. Brown's and

Macomb's brigades were landed on that side to clear the road; and by 10 November the flotilla had reached the Long Saut, and anchored for the night at Chrystler's Farm on the Canadian side. The next morning Brown marched down beside the rapids with his brigade, and Boyd was ordered to take the rest of the troops, some 2,000, with six field pieces, and guard the rear. Brown reported all clear, and the fleet was about to run the rapids when Boyd reported that the enemy was advancing in order of battle. Wilkinson was sick in bed and could give no orders; so was Lewis; and Boyd was left to fight his own battle. He did it as a weak commander usually does, by detachments, which the British crushed in detail, though they had but 800 against 2,000. The battle lasted from about 2.30 to 4.30, when Gen. Covington was killed and his brigade driven back in disorder. Then the whole American line gave way and retreated in haste. Wilkinson reported 102 killed and 237 wounded, and the British claim to 100 American prisoners is more likely to be true than Wilkinson's report of none. The British reported 22 killed, 148 wounded, and 12 missing. The American troops hurriedly re-embarked; the next morning the flotilla ran the rapids to Cornwall. There Wilkinson learned that his colleague, Wade Hampton, had ended operations for the season (see CHATEAUGAY), and at once went into winter quarters. Consult Henry Adams, 'History of the United States,' Vol. VII., chap. 8.

**Chu-Hi**, choo-hē', Chinese scholar and philosopher: b. 1130; d. 1200. As a student of the Chinese classics, he became widely known through his interpretation of the doctrines of Confucius, and became one of the founders of the Chinese school of speculative philosophy. He had a large number of disciples among the scholars, and they, under his direction, compiled a history of China in 59 books, which is still a standard work.

**Chu-Kiang**, choo-ke-äng', or **Canton River**, the "Pearl River" of the Chinese, is the lower part of the Pe-Kiang, and has a navigable channel of about 300 miles. Opposite Canton it is about one fourth mile wide, and is crowded with shipping up to 1,000 tons burden; larger vessels must tie up at a point 15 miles below. About 40 miles below Canton it is called "Boca Tigris," or "The Bogue."

**Chub**, a name given to various species of fishes of the family *Cyprinidae* (q.v.), of which the river chub (*Hybopsis kentuckiensis*) and the creek chub (*Scomotilus atromaculatus*) are the most important in the United States. The name is also sometimes applied to the roach (q.v.), and more rarely to certain marine fishes, as the rudder-fish. The river chub is abundant in rivers and creeks throughout the eastern United States, and may be known by its orange-colored fins and the tuberculate head of the males in spring. It reaches a length of 10 to 12 inches, and is a favorite with the less ambitious anglers in certain regions. The creek chub, or horned dace, is even more widely distributed, and inhabits brooks rather than rivers. It resembles the roach, but has a black spot in front of the dorsal fin and does not exceed a foot in length. The large black chub (*Acrochilus alutaceus*), of the Pacific coast rivers, is known locally as chiselmouth, squaremouh, and hard-

mouth. The English chub (*Squalius cephalus*) is a much larger fish, attaining a length of two feet and a weight of eight pounds, and lives in mountain brooks as well as in rivers. It is a game fish of considerable importance.

**Chub-mackerel**, a fish (*Scomber colias*), found in immense numbers in the Mediterranean Sea. It is the "Spanish mackerel" of England.

**Chubb, Thomas**, English controversialist: b. East Harnham, near Salisbury, 29 Sept. 1679; d. Salisbury 7 Feb. 1747. He was a mechanic who employed his leisure in the acquisition of knowledge from the best English books which he could procure. In 1715 he published 'The Supremacy of the Father Asserted,' the perspicuity and argumentative skill of which obtained for it much notice. Of course a production assailing the orthodox faith did not pass without reply, and a controversial warfare commenced which lasted as long as his life. In 1730 he offered to the world his thoughts on a variety of topics, moral and theological, in thirty-four tracts, collected in a 4to volume, of which book Pope in a letter to Gay speaks with great respect. Various publications followed, for example, 'A Discourse Concerning Reason'; 'The True Gospel of Jesus Christ Asserted'; 'Inquiry into the Ground and Foundation of Religion,' etc.

**Chubb Lock** (so called from the name of the inventor), one of the most intricate of the many-tumbler locks which were first made in England by Barron in 1774. The locks of Chubb have obtained their celebrity partly from their superior workmanship, having more tumblers than usual, with the addition of a lever called the "detector," which is so fixed that, while it does not act under the ordinary application of the key, it cannot fail to move if any one of the tumblers be lifted a little too high, as must be the case in any attempt at picking. The bolt becomes immovably fixed, and thus, while rendering all further attempts at picking useless, gives notice that such an attempt has been made on the next application of the proper key. To draw the bolt after it has been tampered with, it is necessary only to turn the key a little farther forward, as in the process of overlocking; this pushes up a tooth at the end of the detector, restoring the lock to its original position, and the key is then free to turn in the ordinary way. These locks, which were patented as far back as 1818, maintained the reputation of being invincible until the celebrated locksmith Hobbs, of the United States, in 1851 succeeded in picking the most intricate locks of English workmanship, such as Chubbs, Brahms, and Cotterills.

**Chubut**, choo-boot', Argentina, a territory in the northern part of Patagonia, so named from a river which drains a large part of the surface. Its area is about 90,000 square miles. Its principal interest lies in its Welsh settlement, which has remained almost wholly Welsh-speaking. The first settlers, 151, arrived in July 1865. Epochs in its history have been the abandonment of the colony in 1867; the subsequent return from New Bay; a 20 months' nearly complete isolation from the outer world, terminated in 1871. The principal town, Rawson, is situated about five miles from the Atlantic Ocean, and has a population of a few hundreds. English grain and roots are produced, and salt of good quality is found.

## CHUCK-WILL'S-WIDOW — CHURCH

**Chuck'-Will's-Wid'ow**, a large, nocturnal bird (*Antrostomus carolinensis*) related to the whippoorwill, common in the Southern States of the Union. The name is an attempt to reproduce the note of the bird. It is fully 12 inches in length, and is one of the largest of American song-birds, and when uttering its call, opens its mouth enormously. The eggs are laid upon the ground, little or no attempt being made to form a nest. The bird is a voracious eater of insects, its large bristled mouth fitting it for catching flying objects.

**Chuckwal'la**. See LIZARD.

**Chufa**, choo'fā. See NUT-GRASS.

**Chu'kor**, or **Chicore**, a partridge (*Caccabis chukor*), the favorite game-bird of the foothills of the Himalayas.

**Chumbul'**, a large river of Hindustan. It rises in Malwa, in the Vindhya Mountains, about 50 miles south of Oojein, flows north, enters Rajpootana, through which it runs northeast, and falls into the Jumna about 90 miles southeast of Agra, after a course of over 650 miles.

**Chunam'**, in India, a name given to a very fine kind of quicklime made from calcined shells or from very pure limestone, and used for chewing with betel (q.v.). It is also used for plaster, being mixed with fine sand by wetting, and sometimes with various other materials added. It makes a plaster of great durability, capable of being highly polished, and suitable for decorative work.

**Chunar-Ghur**, chūn-ār'gēr, India, a town, fortress, and invalid station in Hindustan, 17 miles southwest of Benares, on the Ganges. The fortress stands on a lofty rock rising abruptly from the river. Chunar was stormed by the British in 1764, and formally ceded to the East India Company in 1768. Pop. 12,000.

**Chung-King**, chūng-kēng', China, a city in Szechuen, on the Yang-tze-Kiang, at its junction with the Kia-ling. It was declared open in 1890, and has acquired a thriving trade. There was a rebellion of the natives here in 1896-8, which checked progress. A railroad to centre at Chung-King is projected, and valuable coal-mines are to be worked. Pop. about 125,000.

**Chuprah**, chūp-rā', or **Chaprah**, India, a town of Hindustan, in Bengal, on the Gogra, near its junction with the Ganges, 32 miles west-northwest of Patna. It is narrow, but extends along the river for four miles. It has government courts and offices, government English school, and is a station of the German Lutheran Mission. Pop. (1901) 45,400.

**Chuquisaca**, choo-kē-sā'ka, Bolivia, a department in the southeastern part of the country, bounded on the north by the department of Santa Cruz, on the east by Brazil, on the south by the department of Tarija, and on the west by the departments of Oruro and Potosi. Its area is variously estimated at from 40,000 to 73,000 square miles, the southern boundary of Bolivia not having been definitely determined. The eastern portion is mostly level, the mountainous parts being in the west. There are large forests and grazing lands, and the soil, where cultivated, is found good for agriculture. Mineral deposits exist, the most valuable being silver,

of which some is mined. Among the other productions are wheat, coffee, sugarcane, and cacao. The capital of the department, and also of the republic, is Sucre (q.v.). The population is about 285,000, embracing 80,000 civilized Indians and 8,000 whites, the rest being wild Indians.

**Church, Albert E.**, American mathematician and military officer: b. Salisbury, Conn., 1807; d. West Point, N. Y., 30 March 1878. He was educated at West Point and was professor of mathematics there 1834-78. His mathematical works include 'Elements of Differential and Integral Calculus' (1842); 'Elements of Analytical Geometry' (1851); 'Analytical Trigonometry' (1857); 'Elements of Descriptive Geometry' (1865).

**Church, Alfred John**, English translator and author: b. London 29 Jan. 1829. He was educated at Lincoln College, Oxford; was ordained in the English Church in 1853, and after holding several head masterships, was professor of Latin in University College, London, 1880-8; and rector of Ashley, Gloucestershire, 1892-7. Beside publishing translations of Tacitus and Livy, he is the author of 'Stories from Homer' (1877); 'Stories from Virgil' (1878); 'A Traveler's True Tale, after Lucian' (1879); 'Stories from the Greek Tragedians' (1879); 'Stories from the East' (1880); 'The Story of Jerusalem' (1880); 'The Story of the Persian War' (1881); 'Stories from Livy' (1882); 'Roman Life in the Days of Cicero' (1883); 'The Chantry Priest of Barnet' (1884); 'With the King at Oxford' (1885); 'Two Thousand Years Ago, or the Adventures of a Roman Boy' (1885); 'Carthage' (1887); 'The Count of the Saxon Shore' (1887); 'Three Greek Children' (1888); 'To the Lions' (1889); 'Burning of Rome' (1891); 'Pictures of Roman Life and Story' (1892); 'Early Britain'; 'Bacon'; 'Callias'; 'Heroes of Chivalry'; 'Lords of the World'; 'Helmet and Spear'; 'Spencer'; etc. His books have been widely read in America.

**Church, Arthur Herbert**, English chemist: b. London 2 June 1834. He was educated at King's College, London, the Royal College of Chemistry, and Lincoln College, Oxford. He was professor of chemistry in the Royal Agricultural College, Cirencester, 1863-79; and has filled the same position in the Royal Academy of Arts from 1879. He is the discoverer of the animal pigment known as turacin, and of churchite, a native cerium phosphate, and has published 'Precious Stones' (1883); 'English Earthenware' (1884); 'The Laboratory Guide' (7th ed. 1894); 'Food' (16th thousand, 1901); 'Josiah Wedgewood' (1894); 'Color'; 'Guide to Corinium Museum.'

**Church, Benjamin**, American soldier: b. Duxbury, Mass., March 1639; d. Little Compton, R. I., 17 Jan. 1718. He commanded forces with distinction in King Philip's war and in the famous battle of 1675 with the Narragansetts won renown. He captured and executed King Philip in 1676. 'Entertaining Passages Relating to King Philip's War' were compiled from his notes by his son Thomas.

**Church, Benjamin**, American physician: b. Massachusetts about 1710; d. 1776. He was graduated at Harvard; became noted for his patriotic writings during the decade preceding

## CHURCH

the Revolutionary War, and was a leader in the "Boston tea-party." He secretly corresponded in cipher with the British, and, being detected, failed to exculpate himself. He was lost at sea while on a voyage to the West Indies.

**Church, Francis Pharcellus**, American editor: b. Rochester, N. Y., 22 Feb. 1839. He was the first publisher and editor of the 'Army and Navy Journal'; afterward, with his brother, he established and edited the 'Galaxy' magazine. He is a leading editorial writer on the New York *Sun*, with which he has been connected for a quarter of a century and is still a proprietor of the 'Army and Navy Journal.' He has published 'Life of Ulysses S. Grant' (1899); and 'Life of John Ericsson' (1891).

**Church, Frederick Edwin**, American landscape painter: b. Hartford, Conn., 4 May 1826; d. New York 7 April 1900. His earliest productions were views of the Catskill Mountains, among which he resided, and a view of East Rock, near New Haven, which attracted very favorable notice. In 1855 he visited South America, and found in the magnificent scenery of that country materials for several of his most admired pictures. After his return he executed his 'View of Niagara Falls from the Canadian Shore,' regarded by many as the most successful representation of the great cataract. Among his other works are 'The Heart of the Andes'; 'Cotopaxi'; 'Morning on the Cordilleras'; 'Under Niagara'; 'The Icebergs'; and 'Sunrise on Mount Desert Island.' After a visit to the Holy Land in 1868 he painted 'Damascus' (1869); 'Jerusalem' (1870); 'The Parthenon' (1871).

**Church, Frederick Stuart**, American artist: b. Grand Rapids, Mich., 1842. He studied at the National Academy of Design, and since 1885 has been a full member thereof. He has achieved note as a realist and is well known as a painter of figures and animals.

**Church, George Earl**, American soldier, engineer and explorer: b. New Bedford, Mass., 7 Dec. 1835. He was a member of the Scientific Exploring Expedition in South America in 1858; served in the Army of the Potomac 1862-5; and was war correspondent in Mexico for the New York *Herald* 1866-7. He made explorations in South America 1868-72; was United States commissioner to visit and report on Ecuador 1880; represented American Society of Civil Engineers at London Congress of Hygiene and Demography in 1891, and was president of the Geographical Society of the British Association in 1898. He is now resident in London where he is vice-president of the Royal Geographical Society.

**Church, Irving Porter**, American civil engineer: b. Ansonia, Conn., 22 July 1851. He was educated at Cornell University and has been professor of applied mechanics and hydraulics in the College of Civil Engineering there, from 1892. He has published 'Statics and Dynamics for Engineering Students' (1886); 'Mechanics of Materials' (1887); 'Hydraulics and Pneumatics' (1890); 'Notes and Examples in Mechanics' (1892).

**Church, John Adams**, American mining engineer: b. Rochester, N. Y., 5 April 1843. He was graduated from the Columbia School of

Mines in 1867, was professor of metallurgy in Ohio State University 1878-81, and was four years in the service of Li Hung Chang in Mongolia, engaged in developing silver mines. He has published 'Notes on a Metallurgical Journey in Europe'; 'The Comstock Lode'; 'Report on Artesian Wells in Arizona.'

**Church, Richard William**, English clergyman: b. Lisbon 25 April 1815; d. London 9 Dec. 1890. He took a first-class at Oxford in 1836, and soon after was elected to a fellowship at Oriel. From 1853 to 1871 he held the rectory of Whatley, near Frome. In 1871 he became dean of St. Paul's Cathedral, London. In 1854 he published 'Essays and Reviews,' and thereby took rank almost at once as one of the most graceful and scholarly writers of the day. His university sermons 'Human Life and its Conditions' (1878); 'The Gifts of Civilization' (1880); and 'The Discipline of the Christian Character' (1885), are profound contributions to religious thought. Other works by him are 'Life of Anselm' (1871); 'The Beginning of the Middle Ages' (1877); 'Dante: an Essay' (1878); 'Spenser' (1879); 'Bacon' (1879); 'The Oxford Movement' (1891); 'Miscellaneous Essays'; 'Occasional Essays.' See 'Life and Letters of,' (1896).

**Church, Samuel Harden**, American writer: b. Caldwell County, Mo., 24 Jan. 1858. He is a railway official in Pittsburg, Pa., and has written 'Oliver Cromwell: a History' (1874); 'John Mannaduke,' a romance (1897); 'Corporate History of the Pennsylvania Lines West of Pittsburg' (1898-1900).

**Church, William Conant**, American journalist: b. Rochester, N. Y., 11 Aug. 1836. He became the publisher of the New York *Sun* in 1860, and was war correspondent of the *Times* (1861-2). In conjunction with his brother Francis (q.v.) he established the 'Army and Navy Journal' (1863), and the 'Galaxy' magazine (1866), and has been a contributor to the 'Century' and other periodicals.

**Church.** This word probably comes from the Greek *kyriakos*, dedicated to the Lord; the Scottish *kirk* and German *kirche* are forms of the same word. It has various meanings; in its widest sense it denotes the whole community of Christians, and was thus used by the New Testament writers. In more restricted significations it denotes a particular section of the Christian community differing in doctrinal matters from the remainder, as the Roman Catholic Church, the Protestant Church, etc.; or to designate the recognized leading church of a nation, as the English, Scotch, or French Church. It is applied in a sense which is manifestly too narrow, when it denotes merely the officers of the church, or clergy. In yet another sense it signifies the building in which Christians assemble for the worship of God, and, referring the reader to the separate articles on the sects into which the community is divided, we shall confine ourselves here to a few remarks, historical and descriptive, on *church* as denoting the edifice appropriated to Christian worship. When in the time of Constantine the persecuted Christians emerged from their meeting-places in upper rooms and in the Roman catacombs to bask in the sunshine of imperial favor, no buildings could be found fitter for their purposes than the

## CHURCH—CHURCH AND STATE IN THE UNITED STATES

basilicas of Rome. The basilica was generally in the form of a parallelogram, with a semicircular apse at one end, which was raised, being approached by a semicircular range of steps. In the centre of this apse was the raised seat of the quæstor or other presiding magistrate; on each side, upon the steps, were places for the assessors, or those engaged on the business being transacted. In front of the apse was placed an altar, where sacrifice was performed before undertaking public business of any importance. The area of the building was divided by two rows of columns, the central division or nave being by far the broadest; over the two smaller divisions or aisles a gallery was often raised. In the small and dark Pagan temple there was neither room nor light enough to conduct Christian worship, but in such a building as above described, the whole congregation of the faithful could meet and take part in the act of worship. The bishop naturally took the place of the quæstor, the priests that of the assessors. The altar on which the pious Pagan poured his libations at the commencement of important business served equally well for the celebration of Christian rites. When in course of time the separation between laity and clergy became complete, the apse was raised off and appropriated to the use of the clergy, then the raised part on which the altar stood was separated by pillars called *cancelli*, and not allowed to be profaned by the multitude. Another change was the introduction of a choir, or enclosed space in the centre of the nave, round three sides of which the faithful congregated to hear the gospel read from two pulpits built into its inclosure on either side, or to hear the services read or sung by the inferior clergy, who occupied its precincts. As time wore on other modifications were introduced; on the erection of new buildings, the symbolic form of the cross was generally adopted as the most suitable for a Christian building; the arms of the cross (the transept) were raised off by rows of columns as the main building had been: at the point of intersection of the transept with the nave a tower was raised, which was at times surmounted by a small spire; frequently two towers were placed at the angles of the entrance end of the edifice. Over the greater part of Europe the style which came to be usually adopted for ecclesiastical buildings was the pointed Gothic, as lending itself more readily to a more majestic and ornamental treatment than the graceful Greek with its columned portico and rounded tower. Circular churches, which were popular at an early date, have found little imitation. The structures which are among the most notable in point of size or historic interest are alluded to in the article on CATHEDRALS. The ordinary churches are generally long rectangular buildings, without transepts, and the tower is placed so as to form the principal entrance, or at one of the angles of that end of the church. Of late years a taste for a superior style of building to that hitherto prevalent has sprung up, even among the dissenting bodies in England and the Presbyterians of Scotland. See ARCHITECTURE.

### Church, an Organization of Christians.

As understood to-day there are two widely different opinions regarding the meaning of a church, and both claim the New Testament as

authority, (1) that Jesus Christ established a definite Church with a code of laws pertaining to belief and government; (2) that he gave us only moral instruction and no definite laws of belief or discipline. Under (1) may be classed those who claim that Jesus Christ established only one Church, and that the churches mentioned by Paul and others of the early missionaries, as recorded in the New Testament, were all parts of the one Church. Still others hold that the Christian Churches of the New Testament were each separate and distinct in government, but one in faith. The Roman Catholic, Greek, Church of England, and all Christian organizations with any generally recognized form of government, whether by presbyters or by the congregation, may be classed under (1). Under (2) will come all who hold that to observe the moral code as taught by Jesus Christ is all sufficient, hence this division need not be treated under the head Church.

The Roman Catholic definition of Church is: "The congregation of all the faithful, who being baptized, profess the same doctrines, partake of the same sacraments, and are governed by their lawful pastors under one visible head on earth, the Bishop of Rome." This implies unity of faith, morals, and government. The Greek definition is the same except they do not recognize as the visible head the Bishop of Rome. The Church of England definition is: "A congregation of faithful men, in which the pure word of God is preached, and the sacraments be duly administered in all those things that are of necessity requisite to the same." In the further authorized explanation of this definition it is shown that the government is given to the bishops without any authoritative head. The same definition is in general use by all other Christian Churches, but in some the government is vested in presbyters, elders, or officers acting as elders; in others the government rests in the congregation or members of the church.

Under the names of the various Christian denominations may be found further information regarding particular doctrines and forms of government.

**Church-ale**, formerly a church festival in England at which ale was drunk liberally; also the ale brewed for such a festival. The name is obviously compounded like *bridal*=bride-ale, *scot-ale*, *clerk-ale*, *bid-ale*, etc. The church-ales were usually held upon Whitsuntide, and two persons were chosen beforehand to preside over the feast, and divide out the victuals and drink voluntarily contributed by the parishioners. Sometimes the drink which had been brewed from malt given by the parishioners was sold about Whitsunday at the church for the support of orphans and poor, the repair of the church, and similar objects. The practice of holding church-ales with the corresponding games was denounced by the Puritans, and is not overlooked in Stubbs' 'Anatomie of Abuses.'

### Church and State in the United States.

That an indispensable function of any government is the conservation of public morals, and that an indispensable method of achieving it is to enforce the public exercise of some religious forms, seemed axiomatic to most people in the 17th century. The tenet that religion is best

## CHURCH ARMY — CHURCH DISCIPLINE

promoted by leaving it to individual discretion was first evolved, naturally, by groups whose best hope was immunity, not establishment. These differing circumstances in the English colonies, with change of views from experience and change of policy from gain or loss of power, resulted in four chief attitudes of the colonial governments toward religion: (1) the establishment of a specific Church, and the taxation of the entire community to support it; (2) restriction of suffrage to church-members, without specifying the church—"theocracy"; (3) requirement of some church form and steady parish service in communities, without establishment of a specific church or disfranchising individuals; (4) entire religious liberty.

The first type is found in the chief Southern colonies and New England. Virginia came first, then Carolina before its division, the "Fundamental Constitutions" (see CAROLINA, ORIGINAL CONSTITUTION OF) merely shaping in this respect the provisions of Charles II.'s charter; lastly Maryland in 1691, after overthrowing the tolerant proprietary government. Each, from the nature of the case, established the Church of England. In New England the form of establishment was peculiar and *quasi*-casual; it was not statutory nor specific, but rested on local taxation to support a church which, owing to circumstances, was at first always the Calvinistic Congregational Church. When other church bodies began to grow, this taxation was remitted to all who supported a church of their own; those who were not thus *bona fide* contributing members to another church paid their cess to the Congregational as before. The second type is represented exclusively by the early Massachusetts Bay and New Haven colonies. The former, 18 May 1631, when as yet there was no popular representation in the colony, enacted "that no man should be admitted to this body politic but such as are members of some of the churches within the limits of the same." This restricted suffrage to one fourth the adult males, and was repealed 3 Aug. 1664. The latter, 4 June 1639, agreed "that church members only shall be free burgesses, and they only shall choose among themselves magistrates and officers" for public business. This, of course, perished with the absorption of the New Haven into the Connecticut colony, in 1662. The third type has but one representative, New York, including the Jerseys. This was "the Duke's" (afterward James II.) constitution, and is not the only ground for a less harsh judgment on him than prevails. The fourth type includes Rhode Island, the product of a quarrel with Massachusetts theology and politics, in which the founder's views developed by force of circumstances as he went on; Maryland, founded by a Roman Catholic who would not have been allowed to establish his own religion; Pennsylvania, equally limited to seeking immunity from persecution; and Georgia, founded late by an enlightened philanthropist.

The Revolution swept away all vestiges of establishment. The Constitution of 1787 provided against a danger not likely to recur. Article VI. enacts: "No religious test shall ever be required as a qualification to any office or public trust under the United States." This, however, did not touch the real likelihood if bigoted sectarians should control the government; the State conventions held to ratify the Constitu-

tion, urged a clause to guarantee full religious liberty; therefore the First Amendment begins: "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof." Even this does not in the least debar individual States from doing it; but most of their constitutions decisively prevent that, not only by direct prohibition, but by enacting that no appropriation of public money shall be made to sectarian institutions. The stability of this provision, the impossibility of evading it, and its incalculable public value, have been proved many times over in the past half century. Sects holding the balance of power in States, or controlling their political managers, have striven desperately to support their institutions by public funds, and managers would have been glad to bribe their support with the money, but the evasions have been very few and insignificant. In the early years of the Union, efforts were occasionally made to have the legislatures enact some test to confine the government to Christians, for fear of atheistic or Jewish control; or to Protestants, in fear of Catholic supremacy; but the absurdity of the first two, and the impolicy of the last, as well as the improbability of its need, have prevented any approach to success. The only serious problem that has arisen on this point is due to Mormonism, where the claim to free exercise of their religion and its dictates is complicated by one of its ostensible revelations enjoining polygamy. The question is clearer if we imagine its enjoining thuggee, or other forms of crime directly subversive of public order. The community must decide how far a practice, not a mere theoretical belief, is inconsistent with its interests, and prohibition of anti-social acts is not interference with freedom of religion. In 1882 Congress prohibited polygamy under severe penalties; and the supreme court held this not in conflict with the constitutional provision above cited.

**Church Army**, a religious organization founded in London in 1882, with the object of training workingmen for church work among the laboring classes, to raise the lower classes of society, and to assist the deserving poor. The work is carried on through mission houses, labor homes, and by means of prison and work-house committees.

**Church Calendar**. A systematic method of arrangement of the feasts of the Christian Church has long been in use, and the record of the time of these feasts is called the Church Calendar. Many of the feasts of the Church occur on a fixed day of the month, as Christmas, 25 December; All Saints', 1 November; Assumption, 15 August, and the feasts of the saints. The "movable" feasts are regulated from the feast of Easter Sunday. (For Easter see CALENDAR.) The fiftieth day after Easter Sunday is "Pentecost"; the eighth day after "Pentecost," "Trinity Sunday," etc. The fasts, except those of Lent, are regulated by the feasts, the records of which are found in the calendar. See also CALENDAR.

**Church Discipline**, the practice of the Christian Church in dealing with such of its office-bearers and members as have by public scandal caused hindrance to its common spiritual life. Its Scripture authority, resting on such passages as Matt. xvi. 19; xviii. 15 (*cf seq.*),

## CHURCH OF ENGLAND—CHURCH OF THE NEW JERUSALEM

is further enforced in Paul's epistles and in the gospel and epistles of John. Discipline, in the ecclesiastical sense, means the laws which are intended to govern the subjects of the Church in their conduct, as distinct from dogmas or articles of faith, which affect their belief. These laws may be based upon the Scripture and tradition or they may be the outgrowth of the condition of the times.

**Church of England.** See ENGLAND, CHURCH OF.

**Church, Fathers of the** (*patres ecclesiae*), teachers and writers of the ancient Church, who flourished after the time of the apostles and apostolic fathers (the immediate disciples of the apostles), from the 2d to the 6th century. This name is also sometimes given to the teachers and writers of the following centuries, down to the schoolmen, who begin with the 12th century. A large number of their writings have been preserved, and have been published by modern scholars. The knowledge of their lives and their works constitutes a particular science, called patristics. The fathers of the Church introduced the Greek and Roman learning into Christian treatises, and many of them were as able as they were learned. Most of the earlier fathers of the Church, before their conversion to Christianity, were rhetoricians or advocates, which accounts for several peculiarities, as well in their method of disputing as in their style. The object of their writings is to defend the Christian religion and the Christian community, refute the Jews, pagans, and heretics, explain the Holy Scriptures, set forth the doctrines of their faith, and the rules of their morality, also the history of Christianity and the Christian Church, and impart instruction to the people. The contents of these writings, therefore, are apologetic, exegetic, dogmatic, moral, historical, polemical, or ascetic. The fathers of the Church are divided into two chief classes—Latin and Greek. The most celebrated among the Greek fathers are Clement of Alexandria, the first who philosophized on Christianity; Origen, distinguished for his homilies and his apologetic and exegetic writings; Eusebius, who wrote the first history of Christianity; Athanasius, who had a decided influence upon the formation of the Christian dogmas; and Chrysostom, the most admired of the ancient Christian orators. The most distinguished among the Latin fathers are Tertullian, a writer of great originality; Augustine, a man of a peculiar and vehement mind, the oracle of the Western Church; Ambrose, distinguished as a Christian orator; and Jerome, a man of much learning, and particularly happy in explaining the Holy Scriptures, whose efforts, however, contributed much to awaken in the West an admiration for the renunciation of the world and the celibacy of priests. Migne's *Patrologiæ Cursus Completus* gives the works of the fathers and many later writers in 388 volumes. Translations are contained in the 'Library of the Fathers of the Holy Catholic Church,' edited by Pusey, Keble, and Newman; and in the Ante-Nicene Christian Library. See also Farrar, 'Lives of the Fathers' (2 vols.).

**Church of God**, an American Christian sect which originated in Harrisburg, Pa., 1830, in a movement in which John Winebrenner, previously a minister in the German Reformed Church, was most prominent. A new society was

organized by him, and others who accepted his views, which took the name of the Church of God. It exists principally in Pennsylvania and the Western States. The government of the Church of God is Congregational, with a supervising Church Council, composed of the preachers in charge, the elders, and deacons. Associations, or conferences of Churches, called Elderships, meet annually, and a General Eldership meets every three years. The church holds the doctrines of the Evangelical churches, with baptism by immersion only, subsequent to faith it practices feet-washing; the administration of the Lord's Supper in the evening; all the instrumentalities of revivals; and protests against the traffic in intoxicating drinks. In 1900 there were 460 ministers, 580 church edifices, and 38,000 communicants. The church property was valued in the same year at about \$750,000. The denomination publishes several newspapers, and sustains a college at Findlay, Ohio. See WINEBRENNER.

**Church of God in Christ**, a recognized body of Mennonites, one of the 12 sects in the United States, about 500 in number. They differ slightly from the regular Mennonites in matters of church government. See MENNONITES.

**Church Government**, the regulation and ordering of spiritual matters, or those pertaining to the discipline and work of the Church. Four leading views are at present entertained regarding church government. The first three agree that the rudiments of a scheme of church government are laid down in the New Testament. They differ, however, as to what that scheme is, much the greater number believing it to be Episcopacy, though one large minority are in favor of Presbyterianism, and another in favor of Congregationalism. The fourth view, which has not a large number of advocates, is that no scheme of government was laid down in the New Testament, applicable to all times and places, but that the church has the power of adapting its government to the special circumstances in which it finds itself at any particular time. See CHURCH, AN ORGANIZATION OF CHRISTIANS.

**Church of the New Jerusalem**, the name taken by a body of Christians who base their belief on the teachings of Emanuel Swedenborg. This sect was founded in 1787, 12 years after the death of Swedenborg, by 15 of his ardent disciples. The founders of the church claim that Swedenborg had a special revelation which authorized him to teach,—as real a command to go forth as was given to the apostles. The system of Christian Doctrine held by this church differs in distinctive points from that held by other Christian churches. They believe of God that he is the creator of all things, that Jesus Christ is God, and that God is all truth, all beauty, all good. The Scriptures are held to be revelations from God through man; and the teachings regarding the future life, are direct revelations from persons of the other world to Swedenborg himself.

The church was established first in England, then the United States, Canada, and in a few places in other parts of the world. In the United States and Canada there are 107 societies, 95 ministers, and about 6,500 members. The active members of the church claim that in

## CHURCH HISTORY — CHURCH, STATES OF THE

the United States and Canada there are altogether about 12,000 believers. For a fuller account see **NEW JERUSALEM CHURCH**; see also **SWEDENBORG, EMANUEL**.

**Church History**, the history of any church, but especially of the Christian Church. Church history naturally divides itself into four periods: From the advent of Christ to the time of Constantine; from Constantine to Mohammed, or by the arrangement of Mosheim and others, to Charlemagne; from Mohammed, or alternately from Charlemagne to the Reformation; from the Reformation to the present time. This division of the subject is not always followed; some authors regard the great periods in Church history, as: Foundation, Persecution; Extension; Reformation. See **CHRISTIAN CHURCH, THE**.

**Church-rate**, in England, a rate raised for the purpose of repairing and sustaining the church, churchyard, and for similar objects. It was made by the churchwardens with consent of the parishioners, who fixed the amount, but could not refuse it altogether, as in that event the churchwardens were empowered to levy a rate for necessary purposes. The rate, though applicable for repairs to parish churches only, was requirable from parishioners of all religious denominations. This often gave rise to complaints, and these led to repeated proposals for its commutation or entire abolition. This last, so far as the rate was compulsory, was effected in 1868.

**Church, States of the**, the Pope's dominions in Italy. They arose with the grant of Pepin, king of the Franks, in 754, who bestowed on Pope Stephen II. some districts which the Lombards, against whom Stephen II. solicited Pepin's assistance, had taken from the Exarchate of Ravenna. Charlemagne confirmed this grant in 774, and in return received the title of Roman Emperor from Leo III. in 800. The wise policy of the Popes in conferring favors on the Normans in Lower Italy secured to them in these vassals staunch protectors of the holy see. The structure of the papal power was fully completed in 1075 under Gregory VII. The dominions of Matilda of Tuscany were added to the states of the Church by her request, and the Popes maintained possession of them against all the claims of the German emperors. The papacy removed a dangerous neighbor belonging to the house of Hohenstaufen by raising the house of Anjou to the throne of Naples in the year 1265. The frequent revolutions of the Romans and the influence of the French led the Popes of the 14th century to transfer their residence, from 1305 till 1376, to Avignon, which Clement VI bought of Joanna, queen of Naples and countess of Provence, in 1348. As this change of residence was made, it was charged under the influence of the king of France, it never obtained the full assent of the Romans and Germans, and anti-popes were sometimes elected by the opposing factions, and the welfare of the Church as well as of the state suffered by their mutual hostilities. After 20 years of exile the Popes returned to Rome. Julius II. added Bologna to the papal dominions in 1513, and Ancona in 1532. The Venetians were obliged to restore Ravenna. Ferrara was also recovered from Modena in 1508, and Urbino was bequeathed to the papal chair in 1626 by its

last duke, Francis Maria, of the house of Rovera. The wise administration of Sextus V. restored internal order toward the end of the 16th century; but the extravagance and family partialities of some of his successors created fresh disorder. Subsequently Naples renounced her feudal obligations to the papal chair. After the successes of the French in Italy the Pope was forced at the Peace of Tolentino, 13 Feb. 1797, to cede Avignon to France, and Romagna, Bologna, and Ferrara to the Cisalpine republic. An insurrection in Rome against the French, 28 Dec. 1797, caused the annexation of the states of the Church to the Roman republic. Pius VI. died in France. The victories of the Russians and Austrians in Italy favored the election of Pope Pius VII., 14 March 1800, who, under the protection of Austrian troops, took possession of Rome. By the concordat concluded in 1801 with the First Consul of the French republic the Pope again lost a great part of his temporal dominions. In 1807 France again declared war, and the provinces of Ancona, Urbino, Macerata, and Camerino were added to the kingdom of Italy. The possessions of the Church beyond the Apennines were all that remained to the Pope. On 2 Feb. 1808, a French corps of 8,000 men entered Rome; the remainder of the papal states were added to France, and a pension of 2,000,000 francs settled on the Pope, whose ecclesiastical power was guaranteed by Napoleon. The decree of 17 May 1809 put an end for the time being to the ecclesiastical state. The Pope was held a prisoner in France until the events of 1814 again permitted him to take possession of his states. Pius VII. was succeeded by Leo XII., who reigned from 1823 till 1829. He was succeeded by Pius VIII., who, in his turn, was succeeded by Pius IX. in 1846. The first acts of this Pope were characterized by such a liberal spirit that diplomatic Europe was surprised. The events of 1848 caused the Pope to pause in his advanced policy, which so dissatisfied the extreme liberal party that they drove Pius IX. from Rome, and the reins of government fell into the hands of Garibaldi, Mazzini, and Avezzano (1849). Some few months afterward the French government, resolving to restore the papal authority, sent Gen. Oudinot with an army against Rome. Defeated in their first attack on the city, the French began a siege in regular form, and in a month's time were masters of it. Pope Pius did not return to Rome, however, until the following year.

After the Austro-Italian war of 1859 the papal see was stripped of the greatest part of its territorial possessions. Embracing before that date an area of 17,218 square miles, with 3,124,668 inhabitants, the Roman territory was then reduced to 4,891 square miles, and 692,106 inhabitants. Of the former legations and delegations into which it was subdivided only five remained, namely — Rome and the Comarca, Viterbo, Civita Vecchia, Velletri, and Frosinone. From 1860 to 1866 the papal government was sustained by the presence of a French army, which was withdrawn in 1866 upon the King of Italy binding himself by treaty to respect the integrity of the Roman states. In 1867, however, revolutionists numbering 15,000, belonging to the Italian party of action, entered the papal territory, headed by Menotti Garibaldi. They made but

## CHURCH TEMPERANCE SOCIETY—CHURCHING OF WOMEN

little progress until the elder Garibaldi placed himself at their head. Napoleon III., at the earnest prayer of the Pope, sent an army to protect the city against the violence of the revolutionists, who had now surrounded it. On 28 October the French entered Rome, and Garibaldi, beginning to perceive that he would be hemmed in by the regular Italian forces under Cialdini, thought of retreating. An advanced section of the papal troops came in contact with the Garibaldians (3 November), and were likely to have suffered severely had not two French battalions, armed with the Chassepot rifle, come speedily to their aid. Garibaldi, with 4,000 men, retreated into the Italian territory, where they were disarmed. A strong force of French troops were left in occupation of Civita Vecchia after peace was restored, and the Pope seemed as secure as ever. But the outbreak of the Franco-German war changed the aspect of affairs. The French army of occupation left Rome on 30 July 1870, and the Pope was at the mercy of his powerful neighbor, Victor Emmanuel, king of Italy, who, seizing the opportunity, marched upon Rome and took it by force of arms. In September the Italian troops occupied Rome. In October the states of the Church were incorporated with the kingdom of Italy, a plebiscite was held under bayonet-rule, the count of which resulted in 133,681 in favor of the Sardinian occupation and 1,807 against it. In the beginning of July 1871, Rome became the seat of the Italian government and the residence of the court.

**Church Temperance Society**, a national organization of the Anglican Church in the United States. It was founded in New York in the year 1881, and its object is to promote temperance by means of high license. It seeks to influence state legislators and municipal authorities, and it has done most effective work in providing substitutes for the saloon. The organization in the United States follows, in a measure, the methods used for several years by the Church of England Temperance Society.

**Churchwarden**, one of two Episcopalian parochial officers chosen annually at the Easter vestries. In Anglican Churches in the United States the wardens are usually elected by the parishes; in England the custom prevails of the rector appointing one warden and the parish the other. Their duties are to protect the building of the church and its appurtenances, to superintend the ceremonies of divine worship, and the proper distribution of alms, etc.; to form and execute parochial regulations, and generally to act as the legal representatives of the parish. They usually attend to the secular affairs of the parish.

The term "churchwarden" is also given to a long-stemmed clay tobacco-pipe much used in Great Britain. A famous "make" of this class of pipes is located in the town of Broseley, in Shropshire.

**Church'll, Charles**, English satirical poet: b. Westminster, February 1731; d. Boulogne, France, 4 Nov. 1764. He took orders in the Established Church, but reflected very little credit upon his clerical profession. He won his fame with 'The Rosciad,' a satire upon the actors of the time, in which only Garrick and some few popular actresses are praised. His

capacity for ridicule was so great that 'The Ghost,' 'The Farewell,' 'The Conference,' 'The Author,' and 'The Prophecy of Famine,' proved exceedingly popular. He is almost without a peer in his special field.

**Churchill, John**, Duke of Marlborough. See MARLBOROUGH.

**Churchill, Randolph Henry Spencer**, LORD, English statesman, third son of the 7th Duke of Marlborough: b. 13 Feb. 1849; d. London 24 Jan. 1895. He was educated at Merton College, Oxford, and having entered Parliament in 1874 as member for Woodstock, by 1884 he had risen to the position of a recognized leader of the Conservative party, and in 1885 became Indian secretary in Lord Salisbury's government. His tenure of this office was rendered notable by the annexation of Upper Burma. On the defeat of Gladstone's Irish bill in 1886 Churchill became leader of the House of Commons and Chancellor of the Exchequer, posts which he unexpectedly resigned in December 1886. He was a brilliant though at times rather violent personality in British politics. His opinions were mainly Conservative, but he often found himself in opposition to the official leaders of that party; and for some time he acted as the leader of what was known as the Fourth Party, consisting of four members who adopted a somewhat independent position. He married in 1874 Jennie Jerome, a daughter of Leonard Jerome, of New York. In July 1900, Lady Randolph Churchill married George Cornwallis West.

**Churchill, Winston**, American novelist: b. St. Louis, Mo., 10 Nov. 1871. He was graduated from the United States Naval Academy in 1894, and became an editor of the 'Army and Navy Journal' the same year. After serving as managing editor of the 'Cosmopolitan' magazine, he turned his attention to fiction. He has written: 'The Celebrity' (1898); 'Richard Carvel' (1899); 'The Crisis' (1901); 'Mr. Keegan's Elopement'; 'The Crossing' (1904).

**Churchill, Winston Leonard Spencer**, English soldier and author: b. 30 Nov. 1874. He was the son of Randolph H. S. Churchill (q.v.), and was educated at Harrow and Sandhurst Military College. He served with the Spanish forces in Cuba, and in the English army during a part of the Boer war 1899-1900. He has published 'The Story of the Malakand Field Force' (1898); 'The River War' (1899); 'Savrola' (1900); 'London to Ladysmith, via Pretoria' (1900); 'Ian Hamilton's March' (1900.)

**Churchill River**, a river of the Northwest Territories of Canada, which rises in La Crosse Lake, forms or passes through various lakes or lake-like expansions, the largest being Big or Indian Lake, and enters Hudson Bay near Fort Churchill, after a northeasterly course of about 800 miles. It is called also Mississinippi, English and Beaver. Except by means of frequent portage, it is not navigable.

**Churching of Women**, a rite founded on the Mosaic injunction found in Levit. xii. 6-8, and as practised in some denominations, is now a giving of thanks for the birth of a child. The first mention of the subject as a usage in the Christian Church is found in the pseudo-nicene Arabic Canon, but no prescribed form is given.

## CHURCHUS — CHURUBUSCO

In the Greek Church the presentation of the child is made on the 40th day after birth, according to Luke ii. 22. The Roman Catholic Church imposes no obligation upon its members in this respect, but recommends it as a laudable and pious custom. The form is prescribed by the Roman Catholic ritual. The priest sprinkles with holy water the woman who kneels at the altar-railing and holds a lighted candle, and having recited the 23d Psalm, he puts the end of his stole into her hand and says: "Come into the temple of God; adore the Son of the Blessed Virgin Mary, who has given thee fruitfulness in child-bearing." The priest then says a prayer of thanksgiving, blesses her, and sprinkles her with holy water in the form of a cross. The rubric of the Roman Catholic ritual reserves this rite for women who have children born in wedlock. The Anglican Church provides in the prayer book a prescribed form for the ceremony. The Congregational, Presbyterian and other churches either ignore, or declare that there is no scriptural warrant for the rite.

**Churchus**, a deity worshipped by the ancient Prussians. It presided over food and drink.

**Churl**, *chêrl* (Saxon *ccorl*) in modern usage, a rude, boorish person, but in Saxon England, the term denoted a common freeman. The rank of the churl, or *ceorl*, steadily declined until finally the only important distinction between churl and serf was that the former might choose his own master. The better class of churls sometimes found their way into the class of theyns, or thanes, corresponding to the knights of post-Conquest times, while the others became the villains of the Norman feudal organization. 'Domesday Book' makes no mention of the word *ceorl*.

**Churn**, a vessel in which cream is agitated to separate its buttery globules in a solid mass from the fluid portions. The length of time usually occupied by this process, and the fatigue consequent upon working those machines by hand, have caused the ingenious to produce numerous modifications in form and size. Some may be worked by dogs in the way a squirrel-wheel is driven; others may be worked by horsepower; and in some cases steam is the motive power. The ordinary plunge-churn, with its cylindrical box, its straight rod projecting downward through the cover and attached below to the dasher, has been greatly improved by an arrangement by which the air is introduced into the cylinder at every stroke by a tube run right along the handle, with a valve at its end which opens as the dasher rises and closes as it sinks. The air is thus dashed through the cream, separating it into innumerable small particles, and throwing it into a state of foam. A box form of churn, with dashers attached to a rod passing horizontally through the box, and driven by a winch, is frequently used. Less common kinds are those in which the whole body of the machine is set in motion, such as the rocking-churn and the barrel-churn. A churn on the centrifugal principle has been introduced into Sweden. Though the rapid completion of the process of butter-making is the principal end in view, it is a well-known fact that butter suffers seriously by too rapid a process. When butter forms in about 45 minutes it is sure to be good; when it appears sooner it is soft; when later, strong-tasted. See BUTTER; DAIRY.

**Churrus**, *chûr'rûs*, the resinous exudation of the leaves and flowers of Indian hemp, *Cannabis indica*. It is used by the natives of India as an intoxicating drug. According to Jaffur Shurreef, a man covers himself with a blanket and runs through a field of hemp early in the morning; the dew and gum of the plant naturally adhering to it are first scraped off and the blanket afterward washed and wrung. Both products are boiled together and an electuary formed. The smoking of five grains of it will produce intoxication.

**Churubusco**, *choo-roo-boos'kô*, **Battle of**, one of the principal engagements of the Mexican war, took place 20 Aug. 1847. Contreras (q.v.) was won in the early morning, Churubusco in the forenoon and early afternoon, of that day, but they are quite distinct battles. The main road north to the city of Mexico, via San Augustin and San Antonio, an elevated paved causeway, converges with that on the west from Contreras and Coyoacan at Churubusco, a village six miles south of the capital and a mile northeast of Coyoacan. Just north of it runs east and west the little stream called Rio Churubusco, crossed by the main road at a bridge fortified with a bridge-head; there was a strong bastion 75 to 100 yards on a side, with embrasures sweeping the San Antonio road. Along the sides were cornfields, maguëy plantations, hedges and thickets, and irrigating ditches full of water. In the western part of the village, southwest of the bridge-head, on the Coyoacan road, was the Convent of San Pablo, a massive building with walls so thick that field-pieces could make no impression on them, defended on two sides by strongly built bastions with six or eight heavy guns, and the building itself an impregnable cover for musket-fire. Around it was a flooded moat, in front were cornfields and thickets. The two points to be carried were the convent and the bridge-head; and since, after the rout at Contreras, this was the last place where the Mexicans could make a stand short of the city of Mexico, the resistance was likely to be desperate. The wreckage of Contreras was being pursued by Pillow and Twiggs along the Coyoacan road; and Worth, having turned the works at San Antonio on the main road, had captured a considerable body of the enemy, and was advancing along the causeway. Santa Anna threw a battalion into the convent, placed five guns and a heavy body of troops at the bridge-head, and posted several regiments along the north bank of the stream. The first assault was made on the convent. Bennet Riley's and Persifor F. Smith's brigades, Dimick's and Taylor's batteries, attacking it from the west and south, were received with a storm of shot and shell from the guns in embrasures and barbette; and as they struggled out of the cover they were swept by the musket-fire from the building itself, with heavy loss. Seizing a line of adobe buildings 60 yards from the convent, they opened fire under that protection and held it till the time for advance. Meantime Worth's division, with Pillow, Cadwalader, Garland, Clarke, and others, had charged down the causeway, blocked for several hundred yards with loaded wagons, and through the fields to the bridge-head. Broken into irregular fragments by the hedges and ditches, they were twice repulsed with tremendous loss by the

plunging fire of the Mexican guns; but Shields had moved north from Coyoacan and, after a fierce combat, which nearly overwhelmed him, he was reinforced by Lee and Sumner, carried the river line, and moved east against the rear of the bridge. In danger of having their retreat from the capital cut off, the Mexicans lost nerve, and a third charge from the Americans carried the head with a rush. Thence they turned southwest against the convent; the American artillery was still battering it on the other side; a sally from the garrison was driven back and, as the fire slackened, both divisions of the Americans entered it from opposite sides at the same time. The American forces in this battle numbered a little over 7,300; the Mexican numbers are uncertain, but probably about 25,000. The American losses at Contreras and Churubusco together were 1,053, not over 100 at Contreras. The Mexican loss was 2,637 prisoners at both, and probably 2,000 at least killed and wounded at Churubusco. Consult Wilcox, 'History of the Mexican War' (1892.)

**Chusan** (choo'san) **Archipelago**, a group of islands off the east coast of China, the largest being the island of the same name, which is about 21 miles long, and from 6 to 11 broad, with a population of about 200,000. Its surface is finely diversified by hill and dale. The rocks are evidently volcanic; and the soil, often very fertile, is under good cultivation, for the most part by spade husbandry. On the same slope may be seen, in different stages of their growth, wheat, tea, sweet potatoes, cotton, and tobacco. There are several towns on the island; the capital is Ting-hae, a walled town of about two miles in circumference. From its situation near the mouths of the Yang-tse-kiang, which forms the great channel of communication with the heart of the empire, Chusan is considered as the key of southern China, and was accordingly taken possession of by the British on two occasions during the first Chinese war. Notwithstanding the great mortality among the British troops during their occupation of the island, the climate is still considered healthy.

**Chutia Nagpur**, choo'tē-ā nāg-poor'. See CHOTA NAGPUR.

**Chutney**, chū'tnī, a condiment compounded of sweets and acids, much used in the East Indies, and thence introduced into England and the United States. Ripe fruit, raisins, spices, herbs, chillies or cayenne, lemon-juice, vinegar, etc., are the ordinary components, which are pounded, well boiled together, and then bottled for use. It is much eaten in India with curries, stews, etc.

**Chuz'zlewit, Martin**, the principal character in Charles Dickens' novel of that name.

**Chyle**, kil, the liquid mixture of food-stuffs taken up by the lacteals from the intestine in the course of digestion. It is not a definite substance, its composition varying very widely according to the character of the ingested food. See DIGESTION; LACTEALS.

**Chyme**, kim, a pulpy mass into which food in the stomach is resolved by the action of the gastric juice and by the contraction of the stomach. This mass is grayish in color, and the previous texture or nature of the aliment can be no longer distinguished. It passes by the

pylorus into the intestinal canal, where it is mixed with the pancreatic juice and the bile. The thinner parts of it are absorbed by the slender tubes termed "lacteals." The liquor thus absorbed, which is called "chyle," (q.v.), is of a white color; it passes through the glands of the mesentery, then enters the thoracic duct, and is conveyed by it into the blood at the junction of the left jugular with the left subclavian vein. Chyle is an opaque milky fluid, mild to the taste. By standing for some time one part of it coagulates, another portion is coagulated by heat. The chyle, after mixing with the lymph conveyed by the absorbent vessels, is received into the blood, which has returned from the extreme vessels before this passes to the heart. All traces of it are very soon lost in the blood, as it mixes perfectly with that fluid. It is probable, however, that its nature is not immediately completely altered. The blood passing from the heart is conveyed to the lungs, where it circulates over a very extensive surface presented to the atmospheric air, with the intervention of a very thin membrane, which does not prevent their mutual action. During this circulation the blood loses a considerable quantity of carbon, part of which, it is probable, is derived from the imperfectly assimilated chyle, as this, originating in part from vegetable matter, must contain carbon in larger proportion than even the blood itself. See DIGESTION; LYMPH; NUTRITION.

**Cialdini, Enrico**, ěn-rē'kō chàl-dē'nē, Italian military officer: b. Castelvetro, Modena, 10 Aug. 1811; d. Leghorn 9 Sept. 1892. By his share in the insurrection of 1831 was forced to escape to France, and in 1835 passing over to the Spanish service, he fought against the Carlists and was made colonel. When Charles Albert headed the Italian rising in 1848, he was employed by the Sardinian government to reduce the volunteers to discipline, and fought at the head of his new regiment in the brief campaign of 1849. In the Crimea he commanded a division of the Sardinian contingent; and on his return was appointed aide-de-camp to the king. He was intrusted by Cavour with the formation of the famous Cacciatori delle Alpi. In the war of 1859 the victory at Palestro was his chief exploit. In 1860 he defeated the papal army at Castelfidardo; in 1861 Gaeta and Messina yielded to him. Created Duke of Gaeta, and for a few months governor of Naples, he had to act against Garibaldi in the second Sicilian expedition (1862). In 1864 he became a senator; and in the war of 1866 occupied Venice almost without a blow. In 1876 he was sent as ambassador to Paris, but he retired in 1881, and received the post of one of the two generals of the army.

**Ciampi, cham'pē, Ignazio**, Italian poet and historian: b. Rome 1824; d. 1880. From 1874 till his death he was professor of modern history in the University of Rome. Among his poetical works are some imitations of the Russian Pushkin; an epic, 'Stella'; and two volumes of 'Various Poems.' He wrote several works on the history of literature, also biographies and histories of special periods. His principal work appeared posthumously: 'Modern History,' from 1492 to the Peace of Westphalia.

**Ciampi, Sebastiano**, Italian scholar: b. Pistoia 30 Oct. 1769; d. Florence 14 Dec. 1847.

Ordained as a priest in 1793, he was appointed professor at the University of Pisa in 1803; owing to some misunderstanding with his colleagues, he accepted in 1818 a professorship at Warsaw, and returned to Italy in 1822, a prebend having been conferred on him in Poland, which enabled him to devote himself to literary studies at Florence. His principal works treat of Italian literature and art, of ancient literature, of the Latin literature of the Middle Ages, and of the history of Poland.

**Ciampoli, Domenico**, dō-mā'nē-kō chām-pō'lē, Italian novelist: b. Atezza in Abruzzi 25 Aug. 1855. His stories and romances are to a great extent pictures of life among the peasantry and mountain folk of southern Italy. He has also written romances of a less local character: 'Diana'; 'The Unknown.' He has devoted special study to Slavic literature, and published several volumes on that subject.

**Cibao**, se-bā'ō, a mountain range in the central part of Santo Domingo; length about 20 miles. When Columbus discovered the island, he was told by the natives that there was gold in the Cibao and he thought it to be a part of Japan. Gold was found there in 1494, by Ojeda.

**Cibber, sīb'bér, Caius Gabriel**, Danish sculptor: b. Flensborg, Holstein, 1630; d. London 1700. He visited England during the protectorate of Cromwell, and met with such encouragement as to induce him to settle there. He was employed to execute the bas-reliefs on the pedestal of the London Monument. The work, however, by which he is principally known are his figures of Raving and Melancholy Madness, formerly erected above the gate of the old Bethlehem Hospital, and now in the new hospital, St. George's Fields. He was the father of Colley Cibber (q.v.)

**Cibber, Colley**, English dramatist and actor: b. London 6 Nov. 1671; d. there 12 Dec. 1757. He was a son of C. G. Cibber (q.v.) and the sculptor's second wife, Jane Colley. He made his appearance at Drury Lane Theatre in 1689. In 1695 appeared his first comedy, 'Love's Last Shift,' which met with great success. In this piece he played the part of Novelty, a fashionable fop. This character is found in most of his pieces, and in the representation of it he was likewise distinguished. His dramatic celebrity is founded chiefly on the 'Careless Husband,' which even obtained the approbation of his declared enemy, Pope. This piece, though without novelty in the characters, and without invention in the plot, is a good picture of the manners and follies of the time. His comedy, the 'Non-juror,' an imitation of Molière's 'Tartufe,' adapted to English manners, appeared in 1717, and was directed against the Jacobites. It was very successful, but drew upon him many enemies, whose number he increased by his conduct as director of Drury Lane Theatre, from 1711. His appointment as poet-laureate in 1730 gave full play to the railery of his enemies. Cibber had the good sense to join in the laugh against his own verses. Pope, however, did not cease to ridicule him on every opportunity. Besides writing original works for the stage, he adapted a great number of others, the acted Richard III. being one of those that have passed through his hands. In 1750 he quitted the theatre, and published the

'Apology for the Life of Colley Cibber,' written with spirit and candor, and containing many entertaining anecdotes and judicious remarks.

**Cibber, Susannah Maria (ARNE)**, English actress: b. London February 1714; d. there 30 Jan. 1766. She was the sister of the celebrated Thomas Arne (composer of 'Rule Britannia'), who taught her music, and introduced her in one of his operas at the Haymarket Theatre. She was so much of a favorite with Handel, that he composed pieces expressly adapted to her voice, and used to instruct her in singing them. In 1734 she married Theophilus Cibber (q.v.), but was soon after separated from him. She subsequently made her appearance in tragedy. Her beauty and her talents gained her universal admiration. Garrick is said to have exclaimed when informed that she was dead, "Then tragedy has expired with her." She is buried in Westminster Abbey.

**Cibber, Theophilus**, English actor and dramatist: b. 26 Nov. 1703; d. Oct. 1758. He was the son of Colley Cibber (q.v.). Among his plays are: 'The Lover' (1730); 'Patie and Peggy' (1730); 'The Auction.' The 'Biography of English and Irish Poets,' which appeared under his name, was from the pen of Robert Shiels, a Scotsman, who purchased for 10 guineas the right of prefixing to the work the name of Cibber, then in prison for debt.

**Cibol**, sīb'ol, a perennial plant (*Allium fistulosum*) of the onion genus, a native of Siberia, with hollow stems larger than those of the chive. It was formerly cultivated in Great Britain for culinary use, but it has been superseded by more palatable species. See ONION.

**Ciborium**, sī-bō'rī-um, the sacred vessel, of silver or gold or silver-gilt, and often incrustured with precious stones, in which the sacred host or sacramental bread is reserved. Its liturgical name is pyx. In the language of architecture, ciborium is the name of the canopy which overhangs the high altar of a church.

**Cibrario, Luigi**, loo-ē'jē chē-brā'rē-ō, Italian historian and politician: b. Turin 23 Feb. 1802; d. Salo 1 Oct. 1870. He studied law, entered the service of the State, and soon distinguished himself by his historical investigations. In 1848, when Italy rose against the Austrians, Charles Albert appointed him commissioner at Venice and a senator of Sardinia. In 1852 he was made minister of public instruction, and ultimately, in 1855, minister of foreign affairs. In 1839 he published his 'Della Economia Politica del Medio Evo'; in 1840, his 'Storia della Monarchia di Savoia'; and in 1847, his 'Storia di Torino.' He published numerous other works on history, numismatics, and miscellaneous subjects.

**Cicacole**, sīk-ā-kōl'. See CHICACOLE.

**Cicada**, sī-kā'da, a large insect of the order Hemiptera, sub-order Homoptera, and family Cicadida, known by its broad head, protuberant eyes, sucking beak, and a well-developed quipositor. The male cicada makes a shrill noise by means of a special apparatus at the base of the abdomen or hind-body. The loud, piercing notes issue from a pair of structures or cavities on the under side of the body, which act somewhat as two kettle-drums or "timbals," each cavity being covered by a tense membrane which is rapidly vibrated by means of two special mus-

## CICATRIZATION — CICERO

cles within. The sound is variously modified by adjacent smaller disk-like sounding-boards, which increase and transmit the sound vibrations caused by the movement of the membrane. The sound is modified by the semicircular disks, one on each side projecting from the metathorax over the "mirrors," cover-plates, or sounding-boards, one on each side, and which, when closed, deaden the sound, or, if open, allow it to escape in greater volume. This apparatus appears to be homologous with the "ears" of the locusts or common grasshoppers. Cicadae have an incomplete metamorphosis, the young (nymphs) being like the parents, but without wings; they live attached by their beaks to the roots of trees, etc. The female deposits her long, slender, cylindrical eggs in gashes in twigs made by her saw-like ovipositor. From 400 to 600 eggs are laid, the process requiring about 45 minutes. The 17-year cicada (wrongly called 17-year locust) is the longest-lived of any known insect, as the grub or nymph lives for over 16 years sucking the roots of forest trees, often several feet below the surface; in the late spring it finishes its transformations, and usually at the last of May or the beginning of June, issues in enormous numbers from the ground. This appearance of a 17-year brood in a given area has been recorded as far back as 1633. At the present time each year has its brood or broods, each limited, as a rule, to a well-defined district. Of such broods there are 30, occurring over a large area in the Atlantic and Central States. In southern New England a brood periodically appears near Fall River and on Martha's Vineyard, as well as in Connecticut, while in Rhode Island its first appearance known in history was in the first week in June 1903, in the town of Coventry, near Tiogue reservoir. The southern limits are northern Georgia and the western limits are eastern Nebraska and Kansas. Besides this 17-year brood there is a 13-year brood, which is more southern, the dividing line being about latitude 38°; this appears to be a temperate variety. The male is very short-lived and takes no food. The females live for several weeks and deposit their eggs about the middle of June in New York and West Virginia. The young hatch, dropping to the ground about six weeks after the eggs are laid; it then burrows into the soil and begins to pierce the rootlets of trees. The nymph molts about once a year or oftener, and Riley estimates the number of molts at from 25 to 30, while there are six stages of growth before the imago or winged state is assumed. Consult: Riley, 'The Periodical Cicada' ('Bulletin 8 U. S. Department of Agriculture'); Marlatt, 'The Periodical Cicada' (Ibid. 14).

**Cicatrization**, sik'a-trī-zā'shōn, the process of healing in the skin of an ulcer or a wound. Where a solution of continuity of the skin is made the blood is thrown out into the gap, the edges of the wound are gummed together by serum, and, springing from both sides of the wound, new connective tissue is formed. This new connective tissue gradually fills the wound with a white glistening mass, the cicatrix. This contracts, and all that may be left of the wound is a white shiny strip of new connective tissue.

**Cicely, Sweet**, a plant of the United States belonging to the natural order *Umbellifer*, a

perennial herb growing from fleshy, clustered, thickish roots. There are about 15 species in North America, western South America, and eastern Asia, grouped into the genus *Washingtonia*, so named in honor of George Washington. Eleven of the 15 are natives of the western United States. They are related to chevril (q.v.) on one side, and to *Scandix* on the other. The smoother sweet cicely (*W. longistylus*) grows in the woods of southern Canada, through Dakota, eastward to North Carolina, southward to Tennessee and Alabama, and westward to Kansas, and on elevations to the height of 4,200 feet. The roots have a rich spicy taste and odor, resembling anise. The sweet cicely of England (*Myrrhis odorata*), although common about buildings, is an imported plant, probably from central Asia. It is fragrant, and its odor is supposed to be particularly agreeable to bees, therefore hives are rubbed with the herb to attract them.

**Cicer**, sī'sēr, a genus of the natural order *Leguminosæ*, of the tribe *Viciæ*, of which the chick-pea (q.v.) is a representative.

**Cicero**, sī's'e-rō, **Marcus Tullius**, Roman orator: b. Arpinum 106 B.C.; d. 7 Dec. 43 B.C. His father, who lived in retirement, devoted to literary pursuits, was the friend of the first citizens of the republic. Among this number was the celebrated orator Crassus, who attended to the education of the young Cicero and his brother, Quintus, selected teachers for them, and directed their studies. The perusal of the Greek authors, together with poetry, oratory, and philosophy, occupied the first years of Cicero's youth. He made one campaign under Sulla, in the Marsic war, and after his return, availed himself of the instruction of the academician Philo, and of the celebrated orator, Molo, and employed several years in acquiring the knowledge requisite for an orator. He witnessed the barbarities of Marius and Cinna, and the proscriptions of Sulla. Cicero, at that time 26 years old, appeared before the tribunals, at first in civil suits, afterward in a criminal process, in which he defended Sextus Roscius of Ameria, who was accused of parricide by Chrysogonus, a freedman of Sulla. He conducted this defense with courage, confuted the accusers, and obliged the judges to acquit the accused. After this brilliant display he remained a year in Rome, and undertook another suit. But debilitated health obliged him to travel; and he went to Athens, still the centre of science, and here he resided in the house of an academician, was visited by the philosophers of all the schools, and profited by the instruction of the masters of oratory. He also undertook a journey to Asia, and remained some time at Rhodes, where he likewise visited the most distinguished orators, and took part in their exercises. On his return to Rome his displays of eloquence proved the value of his Grecian instruction, and his rivals, Hortensius and L. Aurelius Cotta, were forced to yield to him the palm of oratory. At the age of 30, he engaged in public business, became quaestor of Sicily during the prevalence of a scarcity of food at Rome, and managed to convey a large quantity of corn from thence to the capital, though it was difficult for him so to do without exciting the displeasure of the Sicilians. It was an honorable day for Cicero when the ambassadors from

Ordained as a priest in 1793, he was appointed professor at the University of Pisa in 1803; owing to some misunderstanding with his colleagues, he accepted in 1818 a professorship at Warsaw, and returned to Italy in 1822, a prebend having been conferred on him in Poland, which enabled him to devote himself to literary studies at Florence. His principal works treat of Italian literature and art, of ancient literature, of the Latin literature of the Middle Ages, and of the history of Poland.

**Ciampoli, Domenico**, dō-mā'nē-kō chām-pō'lē, Italian novelist: b. Atezza in Abruzzi 25 Aug. 1855. His stories and romances are to a great extent pictures of life among the peasantry and mountain folk of southern Italy. He has also written romances of a less local character: 'Diana'; 'The Unknown.' He has devoted special study to Slavic literature, and published several volumes on that subject.

**Cibao**, se-bā'ō, a mountain range in the central part of Santo Domingo; length about 20 miles. When Columbus discovered the island, he was told by the natives that there was gold in the Cibao and he thought it to be a part of Japan. Gold was found there in 1494, by Ojeda.

**Cibber, sīb'bēr, Caius Gabriel**, Danish sculptor: b. Flensborg, Holstein, 1630; d. London 1700. He visited England during the protectorate of Cromwell, and met with such encouragement as to induce him to settle there. He was employed to execute the bas-reliefs on the pedestal of the London Monument. The work, however, by which he is principally known are his figures of Raving and Melancholy Madness, formerly erected above the gate of the old Bethlehem Hospital, and now in the new hospital, St. George's Fields. He was the father of Colley Cibber (q.v.)

**Cibber, Colley**, English dramatist and actor: b. London 6 Nov. 1671; d. there 12 Dec. 1757. He was a son of C. G. Cibber (q.v.) and the sculptor's second wife, Jane Colley. He made his appearance at Drury Lane Theatre in 1689. In 1695 appeared his first comedy, 'Love's Last Shift,' which met with great success. In this piece he played the part of Novelty, a fashionable fop. This character is found in most of his pieces, and in the representation of it he was likewise distinguished. His dramatic celebrity is founded chiefly on the 'Careless Husband,' which even obtained the approbation of his declared enemy, Pope. This piece, though without novelty in the characters, and without invention in the plot, is a good picture of the manners and follies of the time. His comedy, the 'Non-juror,' an imitation of Molière's 'Tartufe,' adapted to English manners, appeared in 1717, and was directed against the Jacobites. It was very successful, but drew upon him many enemies, whose number he increased by his conduct as director of Drury Lane Theatre, from 1711. His appointment as poet-laureate in 1730 gave full play to the railery of his enemies. Cibber had the good sense to join in the laugh against his own verses. Pope, however, did not cease to ridicule him on every opportunity. Besides writing original works for the stage, he adapted a great number of others, the acted Richard III. being one of those that have passed through his hands. In 1750 he quitted the theatre, and published the

'Apology for the Life of Colley Cibber,' written with spirit and candor, and containing many entertaining anecdotes and judicious remarks.

**Cibber, Susannah Maria** (ARNE), English actress: b. London February 1714; d. there 30 Jan. 1766. She was the sister of the celebrated Thomas Arne (composer of 'Rule Britannia'), who taught her music, and introduced her in one of his operas at the Haymarket Theatre. She was so much of a favorite with Handel, that he composed pieces expressly adapted to her voice, and used to instruct her in singing them. In 1734 she married Theophilus Cibber (q.v.), but was soon after separated from him. She subsequently made her appearance in tragedy. Her beauty and her talents gained her universal admiration. Garrick is said to have exclaimed when informed that she was dead, 'Then tragedy has expired with her.' She is buried in Westminster Abbey.

**Cibber, Theophilus**, English actor and dramatist: b. 26 Nov. 1703; d. Oct. 1758. He was the son of Colley Cibber (q.v.). Among his plays are: 'The Lover' (1730); 'Patie and Peggy' (1730); 'The Auction.' The 'Biography of English and Irish Poets,' which appeared under his name, was from the pen of Robert Shiels, a Scotsman, who purchased for 10 guineas the right of prefixing to the work the name of Cibber, then in prison for debt.

**Cibol**, sīb'ol, a perennial plant (*Allium fistulosum*) of the onion genus, a native of Siberia, with hollow stems larger than those of the chive. It was formerly cultivated in Great Britain for culinary use, but it has been superseded by more palatable species. See ONION.

**Ciborium**, si-bō'ri-um, the sacred vessel, of silver or gold or silver-gilt, and often incrustured with precious stones, in which the sacred host or sacramental bread is reserved. Its liturgical name is pyx. In the language of architecture, ciborium is the name of the canopy which overhangs the high altar of a church.

**Cibrario, Luigi**, loo-ē'jē chē-brā'rē-ō, Italian historian and politician: b. Turin 23 Feb. 1802; d. Salo 1 Oct. 1870. He studied law, entered the service of the State, and soon distinguished himself by his historical investigations. In 1848, when Italy rose against the Austrians, Charles Albert appointed him commissioner at Venice and a senator of Sardinia. In 1852 he was made minister of public instruction, and ultimately, in 1855, minister of foreign affairs. In 1839 he published his 'Della Economia Politica del Medio Evo'; in 1840, his 'Storia della Monarchia di Savoia'; and in 1847, his 'Storia di Torino.' He published numerous other works on history, numismatics, and miscellaneous subjects.

**Cicacole**, sīk-ā-kō'l'. See CHICACOLE.

**Cicada**, sī-kā'da, a large insect of the order Hemiptera, sub-order Homoptera, and family Cicadidae, known by its broad head, protuberant eyes, sucking beak, and a well-developed quipositor. The male cicada makes a shrill noise by means of a special apparatus at the base of the abdomen or hind-body. The loud, piercing notes issue from a pair of structures or cavities on the under side of the body, which act somewhat as two kettle-drums or "timbals," each cavity being covered by a tense membrane which is rapidly vibrated by means of two special mus-

## CICATRIZATION — CICERO

cles within. The sound is variously modified by adjacent smaller disk-like sounding-boards, which increase and transmit the sound vibrations caused by the movement of the membrane. The sound is modified by the semicircular disks, one on each side projecting from the metathorax over the "mirrors," cover-plates, or sounding-boards, one on each side, and which, when closed, deaden the sound, or, if open, allow it to escape in greater volume. This apparatus appears to be homologous with the "ears" of the locusts or common grasshoppers. Cicadae have an incomplete metamorphosis, the young (nymphs) being like the parents, but without wings; they live attached by their beaks to the roots of trees, etc. The female deposits her long, slender, cylindrical eggs in gashes in twigs made by her saw-like ovipositor. From 400 to 600 eggs are laid, the process requiring about 45 minutes. The 17-year cicada (wrongly called 17-year locust) is the longest-lived of any known insect, as the grub or nymph lives for over 16 years sucking the roots of forest trees, often several feet below the surface; in the late spring it finishes its transformations, and usually at the last of May or the beginning of June, issues in enormous numbers from the ground. This appearance of a 17-year brood in a given area has been recorded as far back as 1633. At the present time each year has its brood or broods, each limited, as a rule, to a well-defined district. Of such broods there are 30, occurring over a large area in the Atlantic and Central States. In southern New England a brood periodically appears near Fall River and on Martha's Vineyard, as well as in Connecticut, while in Rhode Island its first appearance known in history was in the first week in June 1903, in the town of Coventry, near Tiogue reservoir. The southern limits are northern Georgia and the western limits are eastern Nebraska and Kansas. Besides this 17-year brood there is a 13-year brood, which is more southern, the dividing line being about latitude 38°; this appears to be a temperate variety. The male is very short-lived and takes no food. The females live for several weeks and deposit their eggs about the middle of June in New York and West Virginia. The young hatch, dropping to the ground about six weeks after the eggs are laid; it then burrows into the soil and begins to pierce the rootlets of trees. The nymph molts about once a year or oftener, and Riley estimates the number of molts at from 25 to 30, while there are six stages of growth before the imago or winged state is assumed. Consult: Riley, 'The Periodical Cicada' ('Bulletin 8 U. S. Department of Agriculture'); Marlatt, 'The Periodical Cicada' (Ibid. 14).

**Cicatrization**, sik'a-tri-zā'shōn, the process of healing in the skin of an ulcer or a wound. Where a solution of continuity of the skin is made the blood is thrown out into the gap, the edges of the wound are gummed together by serum, and, springing from both sides of the wound, new connective tissue is formed. This new connective tissue gradually fills the wound with a white glistening mass, the cicatrix. This contracts, and all that may be left of the wound is a white shiny strip of new connective tissue.

**Cicely, Sweet**, a plant of the United States belonging to the natural order *Umbellifer*, a

perennial herb growing from fleshy, clustered, thickish roots. There are about 15 species in North America, western South America, and eastern Asia, grouped into the genus *Washingtonia*, so named in honor of George Washington. Eleven of the 15 are natives of the western United States. They are related to chevrl (q.v.) on one side, and to *Scandix* on the other. The smoother sweet cicely (*IV. longistylus*) grows in the woods of southern Canada, through Dakota, eastward to North Carolina, southward to Tennessee and Alabama, and westward to Kansas, and on elevations to the height of 4,200 feet. The roots have a rich spicy taste and odor, resembling anise. The sweet cicely of England (*Myrrhis odorata*), although common about buildings, is an imported plant, probably from central Asia. It is fragrant, and its odor is supposed to be particularly agreeable to bees, therefore hives are rubbed with the herb to attract them.

**Cicer**, sī'sēr, a genus of the natural order *Legummosa*, of the tribe *Vicia*, of which the chick-pea (q.v.) is a representative.

**Cicero**, sī's'e-rō, **Marcus Tullius**, Roman orator: b. Arpinum 106 B.C.; d. 7 Dec. 43 B.C. His father, who lived in retirement, devoted to literary pursuits, was the friend of the first citizens of the republic. Among this number was the celebrated orator Crassus, who attended to the education of the young Cicero and his brother, Quintus, selected teachers for them, and directed their studies. The perusal of the Greek authors, together with poetry, oratory, and philosophy, occupied the first years of Cicero's youth. He made one campaign under Sulla, in the Marsic war, and after his return, availed himself of the instruction of the academician Philo, and of the celebrated orator, Molo, and employed several years in acquiring the knowledge requisite for an orator. He witnessed the barbarities of Marius and Cinna, and the proscriptions of Sulla. Cicero, at that time 26 years old, appeared before the tribunals, at first in civil suits, afterward in a criminal process, in which he defended Sextus Roscius of Ameria, who was accused of parricide by Chrysogonus, a freedman of Sulla. He conducted this defense with courage, confuted the accusers, and obliged the judges to acquit the accused. After this brilliant display he remained a year in Rome, and undertook another suit. But debilitated health obliged him to travel; and he went to Athens, still the centre of science, and here he resided in the house of an academician, was visited by the philosophers of all the schools, and profited by the instruction of the masters of oratory. He also undertook a journey to Asia, and remained some time at Rhodes, where he likewise visited the most distinguished orators, and took part in their exercises. On his return to Rome his displays of eloquence proved the value of his Grecian instruction, and his rivals, Hortensius and L. Aurelius Cotta, were forced to yield to him the palm of oratory. At the age of 30, he engaged in public business, became quaestor of Sicily during the prevalence of a scarcity of food at Rome, and managed to convey a large quantity of corn from thence to the capital, though it was difficult for him so to do without exciting the displeasure of the Sicilians. It was an honorable day for Cicero when the ambassadors from

## CICERO

Sicily appeared before him with the request that he would conduct their suit against their governor, Verres. He showed himself worthy of the confidence of an oppressed people, and appeared against this powerful robber after having himself collected proofs of his crimes in Sicily. He was opposed by the celebrated Hortensius. The crimes of Verres are painted in the liveliest colors in his immortal speeches. Seven are preserved, but only two of them were delivered. After this suit Cicero was elected to the office of *ædile* (70 B.C.). Though possessed of only a moderate fortune, he managed by well-timed liberality to gain the affections of the people while he held this office, and at the close of 67 B.C., was elected first *prætor*. But in order to obtain the consulship on which he had now fixed his eyes, it was necessary to obtain the friendship of the great. With this view he joined the party of Pompey, the head of the nobility and the first citizens of Rome, became his panegyrist and most zealous adherent.

Catiline at that time began to plan his conspiracy against the republic. He was accused of extortion in his government of Africa, and Cicero was on the point of undertaking his defense when they became rivals, being both candidates for the consulship. Cicero's merit prevailed over Catiline's intrigues and the envy of his enemies. He was chosen consul unanimously, and entered on his office in 63 B.C. He succeeded in defeating the conspiracy of Catiline (q.v.), after whose fall he received greater honors than had ever before been bestowed on a Roman citizen. He was hailed as the savior of the state, and the father of his country (*parens patriæ*), and thanksgivings in his name were voted to the gods. But Cicero's fortune had now reached the culminating point, and soon was to decline. The conspirators who had been executed had not been sentenced according to law, and Cicero as chief magistrate was responsible for the irregularity. When at the close of his consulship he stood up, according to custom, to render an account of his administration, he was stopped by the tribune, Metellus Celer, on the ground that having put Roman citizens to death without a hearing, he himself was unworthy of being heard. Accordingly he was only able to pronounce the celebrated oath, "I swear that I have saved the republic." Cæsar was always his opponent, and Pompey feared a citizen who loved liberty too much to be favorable to the triumvirs. Cicero saw his credit gradually decreasing, and even his safety threatened. He therefore occupied himself more than ever with science, wrote the history of his consulate in Greek, and composed a Latin poem on the same subject, in three books. At last Clodius, Cicero's enemy, caused a law to be renewed, declaring every one guilty of treason who commanded the execution of a Roman citizen before he had been heard in his own defense. The illustrious ex-consul put on mourning, and appeared, accompanied by the *equites* and many young patricians, demanding the protection of the people. Clodius, at the head of armed adherents, insulted them repeatedly, and ventured even to besiege the senate. Cicero upon this went into voluntary exile, leaving Rome in 58 B.C. Clodius in the meantime procured new decrees, in consequence of which Cicero's country seats were torn down, and a temple of freedom built on the site of his house

at Rome. His wife and children were exposed to ill treatment.

The audacity of Clodius, however, became equally insupportable to all, and Pompey encouraged Cicero's friends to have the orator recalled to Rome. The senate declared that it would not attend to any business till the decree which ordered his banishment was revoked. Through the zeal of the consul, Lentulus, and at the proposition of several tribunes, the decree of recall passed the assembly of the people in the following year, and Cicero returned after an absence of 10 months. The assembled senate received him at the gates of the city, and his entry resembled a triumph. But all power at Rome was now in the hands of the triumvirs, Crassus, Pompey, and Cæsar, and for the next few years Cicero was more of an onlooker than an actor, and even submitted to praise and flattery what he disliked and despised. At the age of 54 he entered the college of the augurs. The death of the turbulent Clodius, who was slain by Milo, delivered him from his most dangerous opponent. He defended the perpetrator of this act, who was his friend and avenger, in an eloquent speech; but the presence of Pompey's soldiers, and the tumult of the friends of Clodius, confused him while delivering it. At this period the senate appointed him governor of Cilicia (52 B.C.). Cicero conducted a war while in this office with good success, repulsed the Parthians, and was greeted by the soldiers with the title of *imperator*. As soon as his term of office had expired he returned to Rome, which was threatened with serious disturbances owing to the rupture between Cæsar and Pompey. Dreading the horrors of a civil war, he endeavored in vain to reconcile the rivals. Cæsar advanced toward Rome, and Pompey was forced to flee with the consuls and the senate. Cicero, not anticipating this sudden approach of Cæsar, was still in Italy. Cæsar saw him at Formiæ, but was not able to gain him over; for although convinced that the party of Cæsar was likely to prevail, and although his son-in-law, Dolabella, was one of Cæsar's confidants, he was prompted by his sense of honor to return to Pompey. After the battle of Pharsalia and the flight of Pompey he refused to take the command of some troops who had remained at Dyrrhachium, but returned to Italy, which was governed by Cæsar's representative, Antony. This return was attended with several unpleasant circumstances, until the conqueror wrote to him, and soon after received him graciously (47 B.C.).

Cicero now devoted himself entirely to literature and philosophy. He was divorced from his wife, Terentia, to enable him to marry Publilia, a beautiful and rich heiress, whose guardian he was; but this union was not happy, and was speedily dissolved. In 45 B.C. the death of his daughter, Tullia, occurred, and affected him very painfully, as he had been devotedly attached to her. The assassination of Cæsar opened a new career to the orator. He hoped to regain great political influence. The conspirators shared with him the honor of an enterprise in which no part had been assigned him; and the less he had contributed to it himself, the more anxious was he to justify the deed, and pursue the advantages which it offered. But Antony took Cæsar's place. Even in this turbulent year Cicero found leisure for literary occu-

pations, and, among other labors, completed his work, 'De Gloria,' which was lost as late as the 14th century. He determined on going to Greece, where he could live in safety; but soon returned to Rome, and composed those admirable orations against Antony, delivered in 43 B.C., known to us by the name of "Philippics," and which are equally distinguished for eloquence and patriotism. His implacable enmity toward Antony induced him to favor young Octavianus, who professed to entertain the most friendly feelings toward him. With him originated all the energetic resolutions of the senate in favor of the war, which the consuls and the young Cæsar were conducting, in the name of the republic, against Antony. Octavianus having possessed himself of the consulate, and formed an alliance with Antony and Lepidus, after the death of the two consuls, the power of the senate and of the orator yielded to the arms of the triumvirs. Cicero was at last convinced that liberty was at an end. At Tusculum, whither he had retired with his brother and nephew, he learned that his name, at Antony's demand, had been added to the list of the proscribed. He went in a state of indecision to the seacoast, and embarked, but contrary winds drove him back to the shore. At the request of his slaves he embarked a second time, but soon returned to await his fate at his country seat near Formiæ. "I will die," exclaimed he, "in my country, which I have more than once saved." His slaves, seeing the neighborhood already disturbed by the soldiers of the triumvirs, endeavored to convey him away in a litter, but soon discovered the murderers at their heels. They prepared for combat; but Cicero, feeling that death was unavoidable, ordered them to make no resistance, bent his head before Popilius, the commander of the murderers, who had once been saved by his eloquence, and suffered death more courageously than he had borne misfortune. He died in his 64th year (43 B.C.). His head and hands were, by the orders of Antony, affixed to the same rostrum from which the orator, as Livy says, had poured forth eloquence unequaled by any human voice.

Cicero's eloquence has always remained a model. After the revival of learning he was the most admired of the ancient writers; and the purity and elegance of his style will always place him in the first rank of Roman classics. The style of his philosophical writings, without oratorical ostentation, breathes the pure Attic elegance which some of his contemporaries wished also to see in his orations. The orator is seen, however, in his prolix and comparatively unanimated dialogues. His philosophical works, the principal part of the contents of which is taken from the Greek, and which combine academic and stoic doctrines and principles, possess very unequal interest for us. Thus, for example, his work, 'De Natura Deorum,' is for us only a collection of errors; the 'Tusculanæ Quæstiones' are full of the subtleties of the Athenian school; his work, 'De Finibus Bonorum et Malorum,' likewise belongs to this somewhat dry dogmatic philosophy. On the other hand, his works on practical morals have maintained their full value. The book, 'De Officiis,' is to this day the finest treatise on virtue inspired by pure human wisdom. The pleasures of friendship and old age have like-

wise been excellently set forth in 'De Amicitia' and 'De Senectute.' Of his political work 'De Republica,' a considerable part was brought to light by Mai, and published in Rome in 1822. Cicero wrote the six books, 'De Republica,' in his 54th year. In these he endeavored to show by what policy, what resources, and what morals, Rome had obtained the dominion of the world. His 'De Divinatione' and 'De Legibus' are instructive monuments of antiquity. The same philosophical spirit is evident in all his oratorical treatises, particularly in the most important of them, 'De Oratore,' although this contains as little of utility for us as the 'Clarissimis Oratoribus,' 'Topicis,' 'De Partitione Oratoria,' etc. The most interesting of all Cicero's works for posterity are his 'Epistolæ Familiæres' and 'Ad Atticum,' which give a more exact and lively idea of the state of the republic than any of his other works, and display most strongly the characteristic traits of the author. See Middleton, 'Life of Cicero' (1741); Forsyth, 'Life of Cicero' (1864); Levin, 'Lectures on the Philosophy of Cicero' (1871); Trollope, 'Life of Cicero' (1880); Nisard, 'Notes sur les lettres de Cicéron' (1882); Gasquy, 'Cicéron jurisculte' (1884); Causeret, 'Sur la langue de la rhétorique dans Cicéron' (1886); Davidson, 'Life of Cicero' (1894); Boissier, 'Cicéron et ses amis' (5th ed. 1895).

**Cicerone**, sîs-e-rō'nē, one who, in Italy, and particularly in Rome, shows and explains to strangers curiosities and antiquities; hence, in general, a guide. The talkativeness of such attendants procured them the name *ciceroni*, in jocular allusion to Cicero. This term is falling into disuse, the official designation, *servitore di piazza*, or simply *guida* (guide), being used instead.

**Cicisbeo**, chē-chēs-bā'ō, a name given since the 17th century in Italy to the professed gallant of a married lady. It was the fashion among the higher ranks in Italy for the husband, from the day of marriage, to associate with his wife in his own house only. In society or places of public amusement she was accompanied by the *cicisbeo*, who even attended at her toilet, to receive her commands for the day. The custom is the more extraordinary, from the natural jealousy of the Italian, who seemed to change his character completely after marriage.

**Ciconia**, sî-kō'nî-a, the genus of birds to which belongs the common stork, the type genus of the family *Ciconiidae*.

**Cicuta**, sî-kū'ta, a poisonous genus of umbelliferous plants commonly known as water-hemlock or cowbane. The plant is a dangerous poison, said to be fatal to cattle that eat it. Persons are known to have died from eating the root, which is white and fleshy. It may be the *koncion* (hemlock) of the Greeks, which Socrates and other persons condemned to death were required to drink. *C. maculata* is the most dangerous species in America. The genus has no general involucre to the compound umbels, and the partial involucre consists of several awl-like bracts. The common or tree hemlock, *Conium maculatum*, is also a poisonous umbellifer, with a stem from two to four feet high, hollow, striated, and spotted with purple; leaves large, much divided, and fetid when bruised; and with unilateral partial involucre, marks by which

## CICERO

Sicily appeared before him with the request that he would conduct their suit against their governor, Verres. He showed himself worthy of the confidence of an oppressed people, and appeared against this powerful robber after having himself collected proofs of his crimes in Sicily. He was opposed by the celebrated Hortensius. The crimes of Verres are painted in the liveliest colors in his immortal speeches. Seven are preserved, but only two of them were delivered. He died in his 64th year (43 B.C.). His head and hands were, by the orders of Antony, affixed to the same rostrum from which the orator, as Livy says, had poured forth eloquence unequalled by any human voice.

Cicero's eloquence has always remained a model. After the revival of learning he was the most admired of the ancient writers; and the purity and elegance of his style will always place him in the first rank of Roman classics. The style of his philosophical writings, without oratorical ostentation, breathes the pure Attic elegance which some of his contemporaries wished also to see in his orations. The orator is seen, however, in his prolix and comparatively unanimated dialogues. His philosophical works, the principal part of the contents of which is taken from the Greek, and which combine academic and stoic doctrines and principles, possess very unequal interest for us. Thus, for example, his work, 'De Natura Deorum,' is for us only a collection of errors; the 'Tusculanæ Quæstiones' are full of the subtleties of the Athenian school; his work, 'De Finibus Bonorum et Malorum,' likewise belongs to this somewhat dry dogmatic philosophy. On the other hand, his works on practical morals have maintained their full value. The book, 'De Officiis,' is to this day the finest treatise on virtue inspired by pure human wisdom. The pleasures of friendship and old age have like-

wise been excellently set forth in 'De Amicitia' and 'De Senectute.' Of his political work 'De Republica,' a considerable part was brought to light by Mai, and published in Rome in 1822. Cicero wrote the six books, 'De Republica,' in his 54th year. In these he endeavored to show by what policy, what resources, and what morals, Rome had obtained the dominion of the world. His 'De Divinatione' and 'De Legibus' are instructive monuments of antiquity. The same philosophical spirit is evident in all his oratorical treatises, particularly in the most important of them, 'De Oratore,' although this contains as little of utility for us as the 'Claris Oratoribus,' 'Topicis,' 'De Partitione Oratoria,' etc. The most interesting of all Cicero's works for posterity are his 'Epistolæ Familiares' and 'Ad Atticum,' which give a more exact and lively idea of the state of the republic than any of his other works, and display most strongly the characteristic traits of the author. See Middleton, 'Life of Cicero' (1741); Forsyth, 'Life of Cicero' (1864); Levin, 'Lectures on the Philosophy of Cicero' (1871); Trollope, 'Life of Cicero' (1880); Nisard, 'Notes sur les lettres de Cicéron' (1882); Gasquy, 'Cicéron jurisconsulte' (1884); Causeret, 'Sur la langue de la rhétorique dans Cicéron' (1886); Davidson, 'Life of Cicero' (1894); Boissier, 'Cicéron et ses amis' (5th ed. 1895).

**Cicerone**, sîs-e-rō'nē, one who, in Italy, and particularly in Rome, shows and explains to strangers curiosities and antiquities; hence, in general, a guide. The talkativeness of such attendants procured them the name *ciceroni*, in jocular allusion to Cicero. This term is falling into disuse, the official designation, *servitore di piazza*, or simply *guida* (guide), being used instead.

**Cicisbeo**, chē-chēs-bā'ō, a name given since the 17th century in Italy to the professed gallant of a married lady. It was the fashion among the higher ranks in Italy for the husband, from the day of marriage, to associate with his wife in his own house only. In society or places of public amusement she was accompanied by the *cicisbeo*, who even attended at her toilet, to receive her commands for the day. The custom is the more extraordinary, from the natural jealousy of the Italian, who seemed to change his character completely after marriage.

**Ciconia**, sî-kō'nî-a, the genus of birds to which belongs the common stork, the type genus of the family *Ciconiidae*.

**Cicuta**, sî-kū'ta, a poisonous genus of umbelliferous plants commonly known as water-hemlock or cowbane. The plant is a dangerous poison, said to be fatal to cattle that eat it. Persons are known to have died from eating the root, which is white and fleshy. It may be the *koncion* (hemlock) of the Greeks, which Socrates and other persons condemned to death were required to drink. *C. maculata* is the most dangerous species in America. The genus has no general involucre to the compound umbels, and the partial involucre consists of several awl-like bracts. The common or tree hemlock, *Conium maculatum*, is also a poisonous umbellifer, with a stem from two to four feet high, hollow, striated, and spotted with purple; leaves large, much divided, and fetid when bruised; and with unilateral partial involucre, marks by which

the common hemlock is readily distinguished from the water-hemlock, and from any other species of the *Umbelliferae*. It is indigenous in most temperate climates, and is extensively used in medicine, being given internally as a sedative, and applied externally to sores, ulcers, etc., in the form of a poultice or ointment. The Latin *cicuta* was the true hemlock. See **HEMLOCK**; **WATER-HEMLOCK**.

**Cid, El**, *āl thīd* or *ēl sīd*, the popular name of a Spanish national hero, Rodrigo (or Ruy) Díaz: b. Bivar about 1040; d. 1099. Legend and tradition have somewhat obscured the character of the historical Cid, but the main facts of his life are well established by Spanish and Arabic records. He first appears in national history when Sancho, the eldest son of Ferdinand I, and king of Castile, was at war with his brother, Alfonso; at this time he was already known as the *Campadon* (the champion), a name which he won probably by vanquishing in single combat the champion of Sancho of Navarre. In the war with Alfonso Sancho was victorious, and this success was owing to the Cid, to whom he had given the command of his forces. Alfonso was taken prisoner, and it remained only to overcome the obstinate resistance of Zamora, where Sancho's sister, Urraca, ruled. Before the walls of this city Sancho was assassinated, and Alfonso was called to the throne. It is asserted—but the historical evidence here is not complete—that before recognizing Alfonso's authority the Castilian nobles required of him an oath that he had no part in his brother's murder, and that it was the Cid who administered this oath, in 1073. Whatever the facts, Alfonso must have thought it wise to conciliate the good-will of the Castilian grandees until at least his own position became secure, as he gave his cousin Jimena (or Ximena), daughter of the Count of Oviedo, to the Cid in marriage. The marriage contract, dated 1074, is preserved at Burgos. Later the king, taking advantage of a pretext that the Cid had attacked the Moors without obtaining the royal consent, banished him. Old wrongs which the king still remembered probably furnished the real motive. Then began that career of "soldier of fortune," which, idealized by tradition, has made the Cid the perfect cavalier of Spain. He first offered his services to the Christian Count of Barcelona, and, when refused by him, to the Moorish king of Saragossa, who accepted the offer. The Cid remained in Saragossa till 1088, fighting against Moors and Christians alike, and rising to unusual distinction and power. In 1088 the attention of Mostain, the king of Saragossa, was drawn to the city of Valencia, then under the protection of King Alfonso. The Almoravides, a new Moslem sect from northern Africa, defeated Alfonso in battle, and caused him to withdraw his protection from Valencia, and the governor of the city appealed to Saragossa for help. The Cid was sent to the aid of the city in command of an expedition which proved successful, and he established himself in Valencian territory. As the recognized protector of the lawful king, in reality, the suzerain of Valencia, he received a generous tribute; but it is clear that he had already resolved, when opportunity offered, to secure the city for himself. Meanwhile he skilfully held off, now by force, now by ruse, all other competitors, Christian and

Moslem alike: including among these King Alfonso, whose territories he once wasted with fire and sword. As head of an independent army, he made successful forays in all directions; despoiling, levying tribute, garrisoning strongholds, and strengthening his position in every way, and in 1094 finally became master of Valencia itself. He successfully held the city till 1099, when the troops he had sent against the Almoravides were utterly routed, few escaping, and he already enfeebled in health, died, it is said, of grief and shame. His widow held Valencia for two years longer.

The Cid very soon became the favorite hero of popular songs. It is probable that these songs were at first short stories in rude metrical form; and that the epic poems, dating from about 1200, used them as sources. The earliest of the epic poems is 'The Poem of My Cid,' based upon history, but with a large amount of legendary matter. Its date is probably about 1200. It is one of the best of mediæval folk epics, its characters being drawn with clearness and simplicity. Another poem of about the same date, 'The Legend or Chronicle of the Youth of Rodrigo,' is of inferior merit, though not without fine passages. Two centuries and more after these poems we meet with the 'Romances' or 'Ballads of the Cid.' The earliest of these do not in their present form far antedate 1500. These ballads are derived from all sources, but chiefly from the Cid legend, which is here treated in a lyric, and popular tone.

These ballads make Jimena (or Ximena) Gomez the wife of the Cid, and tell the legendary story of her father (Don Gomez), insulting the Cid's father, of the Cid's revenge by killing Don Gomez, of Jimena's pursuit of the Cid demanding justice of King Ferdinand, and the final reconciliation through marriage. De Castro, in his drama, 'The Youth of the Cid,' drew his material from the ballads, but added love and the conflict between affection and the claims of honor in the mind of both Jimena and the Cid. Corneille, based his drama, 'The Cid,' upon that of Castro, using the same plot and the same struggle between love and duty on the part of the hero and heroine. Corneille condensed De Castro's 'The Cid,' gave it dramatic unity, and added greater dignity and nobility to the verse. His drama, when first put on the stage in France (1636), met with immediate success.

**Ci'der**, the expressed juice of apples; a beverage, the quality of which depends principally on the following particulars: Kind of fruit, condition of the fruit when ground, manner of grinding and pressing, method of producing fermentation, and precautions to be taken against its excess.

**The Kind of Fruit.**—The characteristics of a good cider apple are a red skin, yellow and often tough and fibrous pulp, astringency, dryness, and ripeness at the cider-making season. When the rind and pulp are green, the cider will always be thin, weak, and colorless; and when these are deeply tinged with yellow, it will, however manufactured, or in whatever soil the fruit may have grown, almost always possess color and either strength or richness. The most certain indications of the ripeness of apples are the fragrance of their smell and their spontaneously dropping from the trees. When they are in this

## CIENFUEGOS

state of maturity on a dry day (all the better if the weather is cool and bracing), the limbs may be slightly shaken and partly disburdened of their golden store; thus taking such apples only as are ripe, and leaving the unripe longer on the trees, that they also may acquire due maturity. They must be carefully gathered to avoid bruising, as mold rapidly fixes upon the edges of every wound of a fruit gathered in autumn, and communicates a disgusting flavor to the juice. The only artificial criterion for ascertaining the quality of an apple for cider is the specific gravity of its must, or unfermented juice; or the weight compared with that of water. This indicates with very considerable accuracy the strength of the future cider. Its weight and consequent value are supposed to be increased in the ratio of the increase of saccharine matter. The strongest and most highly flavored cider which has been obtained from the apple was produced from fruit growing on a shallow loam, on a limestone basis. All the writers on the subject seem to agree that calcareous earth should form a component part of the soil of a cider orchard. A dry and somewhat loose soil is preferred.

*Condition of the Fruit.*—Fruit should be used when it has attained full maturity, and before it begins to decay. Each kind of apple should be manufactured separately, or at least those kinds only should be mixed which ripen about the same time. The longer the fruit remains on the tree without decay or being injured by frost the better, for not only is the perfect maturity of the juice an important consideration, but the colder the weather, short of actual frost, the more quiet and equable will be the fermentation. When gathered the apples should be carefully stored in some shady, cool room, and placed in heaps to undergo a further ripening, and acquire more saccharine matter while losing a considerable quantity of watery juice.

*Grinding, etc.*—This operation should be deferred till December, if possible. It is absolutely essential that the weather should be cold, even slightly frosty, to counteract the tendency to rapid fermentation. The apples should be reduced by the mill as nearly as possible to a uniform mass, in which the rind and seeds are scarcely discoverable, and the pomace should be exposed to the air. It has been ascertained that, by exposing the reduced pulp to the operation of the atmosphere for a few hours, the specific gravity of the juice increases from 1.064 to 1.078. For fine cider the fruit should be ground and pressed imperfectly, and the pulp then exposed 24 hours to the air, being spread and once or twice turned, to facilitate the absorption of oxygen; it should be then ground again, and the expressed juice added to it before it is again pressed. The best method of grinding the apples is to employ cylindrical rollers placed so near each other as to crush them. They are fed from a hopper above them, from which the apples pass between a pair of fluted or toothed cylinders, by which they are torn and partially crushed before reaching the more perfectly crushing apparatus below. The mass is then powerfully pressed, and the cider is run into casks.

*Fermentation.*—The vinous fermentation commences and terminates at different periods, according to the condition and quality of the fruit and the state of the weather. The best

thing whereby to judge of the proper moment to draw the liquor from the scum and sediment is the brightness of the liquid which appears after the discharge of fixed air has ceased and a thick crust has collected on the surface. The clear liquor should then be drawn off into another cask. If it remains bright and quiet, nothing more need be done to it till the succeeding spring; but if a scum collects on the surface it must immediately be racked off again, as this would produce bad effects if suffered to sink. Among the precautions used to prevent excessive fermentation is stumming, which is fuming the cask with burning sulphur. This is done by burning a rag impregnated with sulphur in the cask in which the liquid is to be decanted, after it has been partly filled, and rolling it so as to incorporate the liquid with the gas.

**Cienfuegos**, thē-ān'foo-ā'gōs, **Nicasio Alvarez de**, al'bā-rēth dā, Spanish poet: b. Madrid 14 Dec. 1764; d. Orthez, France, July 1809. He studied at Salamanca at the time when the modern school of Spanish poetry was founded there by Cadalso and Melendez. He attached himself to this school, and in 1798 laid the foundation of his literary fame by the publication of a collection of poems. Shortly after he became editor of the government newspapers, *La Gaceta* and *El Mercurio*, and was appointed to the department of foreign affairs. He was in possession of this office when the war of Independence broke out. Madrid was occupied by the French, and Cienfuegos, having both offended Murat by an article in *La Gaceta* and taken part in the insurrection of May 1808, was brought to trial and condemned to death. At the intercession of some influential friends the sentence was commuted to banishment to France. His tragedy, 'Pitaco,' had procured his admission to the Spanish Academy. He also wrote the tragedy of 'Idomeneo,' and the comedy of the 'Magnanimous Sisters.' His tragedies are considered his best works.

**Cienfuegos**, thē-ān'foo-ā'gōs, Cuba, a city in the province of Santa Clara, on the south side of the island. Its harbor, which is one of the finest in the West Indies, was visited by Columbus on his first voyage, and was surveyed by Ocampo in 1508. The town was settled by refugees from Santo Domingo in 1819. Here the revolutionist Narciso Lopez planned to make his first demonstration on 4 July 1847. In recent years its commercial progress has been rapid, and it is now the second seaport of Cuba. Some of the sugar estates in the neighborhood are very large, and conducted on the most approved modern plan; in fact, Cienfuegos is the centre of the sugar trade on the Caribbean coast. It is a city of attractive, well-shaded streets, and substantially built houses. One of its plazas is the largest in Cuba. Among the principal buildings are the governor's house, market, railroad station, and military and government hospitals. Water from the aqueduct is supplied to 42 per cent of the dwellings; from wells, to 47 per cent; from cisterns, to 7 per cent. There are social clubs, a theatre, etc. The city is lighted by gas and electricity. The climate from May to November cannot be highly commended, the air having an excess of moisture, and the temperature ranging from 75° to 98° F. The winter months, however, are very agreeable, winds from the north prevailing, and

the temperature ranging from 60° to 78° F. during the day, with cooler nights. Cienfuegos is connected by rail with Sagua la Grande, on the opposite coast; with Santa Clara, the western terminus of the Cuba Company's main line to Santiago; with Havana, etc. By steamer it is in regular communication with New York, as well as with ports of the southern coast of Cuba from Santiago to Batabano. The population (United States War Department census, 1899) is 30,038. Occupied dwellings number 4,967. Number of inhabitants engaged in trade and transportation, 3,065; in agriculture, fisheries, and mining, 901; in personal service, 4,004; in manufactures and mechanical industries, 3,221; in professional service, 294; without gainful occupation, 18,553. Total school attendance 3,832. Number of persons able to read 18,052, or 60 per cent — a higher percentage in this respect being found among Cuban cities only in Havana (66 per cent) and Puerto Principe (62 per cent). Foreign-born are 11.6 per cent of the city's population. The white people number 19,220; negroes, 3,068; mixed, 7,401; and Chinese, 349. For a time during the Spanish-American war the harbor of Cienfuegos was blockaded by Admiral Schley.

**Cieza**, thē-ā'thā, Spain, a town in the province of Murcia, and 24 miles northwest of the city of Murcia, on an eminence near the right bank of the Segura. It has spacious streets, a large church and ancient tower, manufactures of linen and hempen fabrics, and a trade in corn, wine, oil, and silk. Pop. 14,000.

**Cigar** (of uncertain etymology; it cannot be connected with any West Indian speech, and the derivation at present most common among scholars is from Sp. *cigarra*, cicada, in allusion to a similarity of outline; Sp. *cigarro*. Also incorrectly spelled *Segar*), a compact roll of tobacco, for smoking. This form was borrowed by the Spanish invaders from the Indians of Cuba. When the Spaniards found that tobacco would grow elsewhere, they transplanted it to their possessions in the Philippines and in other localities. The Manila cheroot is the common method of smoking tobacco in the Far East. This cheroot is cut off evenly at both ends and is shorter than American cigars. Rolling tobacco into cigars was not generally practised in Virginia and the Carolinas for a long time after the settlement of those sections by the English, for there the Indians invariably smoked their tobacco in pipes, but finally the convenience and superior flavor these rolls possessed made their use quite common some years before the Declaration of Independence of the American colonies. In Cuba, Mexico, and Central America and, in fact, in all Spanish-speaking countries, the use of a pipe to this day is a rarity, the inevitable *cigarro* or *cigarette* ("little cigar") being found constantly in use.

The moist climate, the character of the soil, and the peculiar preservative qualities of the air make Cuba the true home of the perfect cigar. There are but half a dozen valleys, mostly in the western end of the island, where the finest cigar tobacco is grown and cured, the most important being the Vuelta Abajo district. Perhaps the next best comes from Porto Rico. The removal of the duty on manufactured cigars from that island in 1903 flooded

the United States with cigars from there, many of them very inferior. In order to avoid paying the high duties on Cuban-made cigars, the device was early tried of bringing the tobacco over to the small island of Key West, a part of the State of Florida, separated from Cuba by only an 80-mile-wide strait. It was thought that the climatic conditions there would be so similar to those of Cuba that an equally fine cigar could be made there, while the importation of the tobacco in bulk cut down the duties very materially. The "Key West" cigar is much cheaper than the one made in Cuba, but the flavor, for some reason, is inferior. The manufacturers even brought cigarmakers from Cuba to Key West, so that so far as possible the product might be the same as the original, but in vain. It has been discovered by experts of the department that in Ohio and Texas are certain areas which possess a soil so similar to that of the celebrated Vuelta Abajo district of Cuba that it is possible to raise tobacco there that will equal the Cuban. Samples of the leaf grown there and submitted to dealers in New York and Philadelphia, who were not told where it came from, proved to be so similar to that of Cuba that it was pronounced pure Havana leaf of the best quality. The pioneer in the manufacture of Key West cigars was Gen. J. H. Gregory, who gained his military title in the first war for Cuban independence, and was familiar with the internal resources of Cuba.

Tobacco comes to the cigar manufactories in bundles, that intended for wrappers being kept separate. The best tobacco for wrappers is grown in Sumatra. Connecticut wrappers are also much used, being supple and tough. The best cigars made within the limits of the United States are undoubtedly those of Cuban tobacco manufactured in Key West, with a Connecticut wrapper. Those with Virginia, Carolina, Pennsylvania, and other tobaccos as a filler, with the Connecticut wrapper, are of inferior quality, but sell in large quantities, because of their cheapness. The operative spreads the filler leaf on his bench, with a small quantity of the wrapper beside him. He rolls the filler into the proper shape and firmness, then deftly cuts a portion of leaf to form a wrapper, winds the wrapper about the filler, and secures the ends with paste. This is the standard method. Some poorer grades are made by machinery, but the results are not satisfactory and hand-made cigars are still the best and most expensive. Scattered throughout the United States are thousands of large and small factories for the manufacture of cigars, many of them using little machinery. In 1901 there were 6,914,639,012 cigars and 2,728,153,607 cigarettes made in this country. The production of cigarettes has decreased since 1896, when it was 4,967,444,232, the greatest number ever made, and exceeding the number of cigars for that year by over 900,000,000. The reason for this is the persistent fight constantly waged against the cigarette as injurious, most States having stringent laws regulating its sale. The value of this finished cigar product to the makers is probably about \$250,000,000 annually, the consumer paying about \$750,000,000 for it. This does not include the imported article, about 75,000,000 coming from Cuba (1903) and 125,000,000 from Porto Rico and the Philippines. There are some few thousands

of cigarettes imported from Egypt and Turkey, though most of those called so are made in this country from American tobacco. Altogether the number of cigars and cigarettes made or brought into the United States at present is about 13,000,000,000. For further details, including the preparation of tobacco-leaf, see the article *Tobacco*.

**Cigarette.** See *Cigar*.

**Cignani**, chên-yā'nē, **Carlo**, Italian painter: b. Bologna 15 May 1628; d. Forlì 6 Sept. 1719. He was a pupil of Albano. He knew how to compose, like the Caracci, and to distribute his figures in such a way that his paintings appear larger than they really are. His finest fresco paintings are at St. Michael in Bosco, at Bologna, in ovals supported by angels, and in the saloon of the Farnese Palace, where he represented Francis I. of France touching for the king's evil. In his painting of the Assumption, at Forlì, he has imitated the beautiful Michael of Guido in the cupola at Ravenna, and other fine conceptions of this painter; but in other pieces he made Correggio his model. He does not so often introduce foreshortenings as the Lombards; and in his outlines and drapery he possesses a finish peculiar to himself. His pencil is powerful, and his coloring lively. Clement XI. conferred on him several marks of distinction. His paintings have been engraved by various artists.

**Cignaroli**, Giovanni Bettino, jō-vā'nē bēt-tē'no chên-yā'rō'lē, Italian painter: b. Salò, near Verona, 1706; d. Verona 1 Dec. 1770. His best works are in the cathedrals of Pisa, Bergamo, Mantua, and in the churches of his native city and of Ferrara. He educated a numerous school at Verona, and received several invitations to visit foreign courts, which he invariably declined. In style he resembled Carlo Maratti, but formed himself on the works of Guido and Correggio. He was a man of literary culture, and wrote with discrimination and taste on various subjects.

**Cilia**, sīl'ī-ā (Latin, "eyelashes"), small, generally microscopic, hair-like organs or appendages, averaging  $\frac{1}{100}$  inch in length, found on the surface of the tissues of most animals, and in some vegetable organisms (as algæ), chiefly on tissues which are in contact with water, or which produce fluid secretions. They are constantly in a state of active movement, and communicate to the fluid with which they are in contact a corresponding motion. This is called vibratile or ciliary motion. In most of the lower aquatic animals the respiratory function is aided by means of the vibratile cilia; many animalcules move by a similar mechanism; and in the highest classes of animals cilia have a share in the performance of some important functions.

**Ciliata**, sīl'ī-ā'tā, a group of *Protozoa*, and to which belong most of the *Infusoria* (q.v.). The body is covered with cilia, and it is either free or stalked and attached to submerged plants, etc. The group comprises the most specialized *Protozoa*, including the trumpet-animalcule (*Stentor*), the bell-animalcules (*Vorticella* and *Epistylis*). In these one-celled animals there is for the first time in the animal kingdom, as we ascend from the simplest organ-

isms, a permanent aperture (cytostome) corresponding to the mouth of the higher animals, and an œsophagus (cytopharynx), and the undigested or waste portions of the food are cast out at a fixed point or opening (cytopyge), usually not detected when not used. There is also in the *stentor*, etc., a definite spiral muscle, while netting bodies (trichocyst), like minute rods, in rare cases occur, and are supposed to be defensive in their nature. The ciliate infusoria reproduce by fission, budding, and also by conjugation, molting in the origin of spores or embryos. Certain forms are parasitic; thus the skin disease called eczema has been attributed to the presence of parasitic *vorticellæ*, and a flattened oval free form occurs in the large intestines of men ill with diarrhoea.

**Cilicia**, sī-līsh'ī-ā, in ancient geography the region between Pamphylia and Syria, lying south of Mount Taurus. The inhabitants of the coasts were formidable as pirates, and even disturbed the Ægean and Ionian seas. The inhabitants of the northern portion lived in part a nomadic life; those in the east were devoted to agriculture. Alexander made Cilicia a Macedonian province; it then passed to the Syrians. Pompey subdued its piratical inhabitants. The mountainous parts were left in the hands of the native princes; the rest, in 67-6 B.C., was constituted a Roman province, of which Cicero was proconsul in 51-50 B.C.

**Cimabue**, Giovanni, jō-vā'nē chē-mā-boō'ā, Italian artist: b. Florence 1240; d. there about 1302. Two Greek artists, who were invited to Florence by the senate to paint a chapel in the church of Santa Maria Novella, were his first masters. Although these artists handled the pencil awkwardly, they however taught him, according to ancient tradition, the proportions which the Greek artists had observed in their imitations of the human figure. Attentive to their instructions, Cimabue studied principally the fine antique statues. He was the first to point out to succeeding painters the elements of the *beau idéal*, the memory of which had been extinguished during several centuries of disorder. It is true the paintings of Cimabue do not exhibit that harmonious distribution of light and shade which forms the chiaroscuro. His coloring is dry, flat, and cold; the outlines of his figures intersect each other on a blue, green, or yellow ground, according to the effect which he had in view. He had no idea of linear and aerial perspective. His paintings are, properly speaking, only monochromes. But these faults, which are to be attributed to the infancy of the art, are compensated for by beauties of a high order—a grand style, accurate drawing, natural expression, noble grouping, and a fine disposition of his drapery. His best paintings are in the church of Santa Maria Novella at Florence, and in the Sacro Convento at Assisi. He may be considered the link between the ancient and modern schools of painting. Cimabue evinced a generous appreciation of Giotto, whom tradition says he discovered drawing figures on the smooth surface of a rock while tending his sheep, and whom he took with him to Florence, and instructed with such success that the pupil soon excelled his master. It should be added that there is very little corroborating testimony regarding the works

## CIMAROSA — CIMMERIANS

attributed to him by Vasari, and a recent destructive critic has written in the 'Nineteenth Century' for March 1903, "All, then, that we know about this Cenni di Pepi is that he was a distinguished Florentine artist; that he was nicknamed Cimabue; that he flourished in the closing years of the 13th century and the early years of the 14th, and that he executed a mosaic and an altar-piece at Pisa, of which the latter has disappeared and the former has been entirely renewed."

**Cimarosa, Domenico**, dō-mā-nē'kō chē mā rō zā, Italian composer: b. Aversa, near Naples, 17 Dec. 1749; d. Venice 11 Jan. 1801. He received his first musical instruction from Sacchini, entered the conservatory of Loretto, where he imbibed the principles of the school of Durante, and studied with great assiduity. He soon displayed his superiority in the 'Sacrificio di Abramo,' the 'Olimpiade,' and other compositions. At the age of 25 he had already gained the applause of the principal theatres of Italy. He was invited to St. Petersburg (where he remained four years) and to several German courts to compose heroic and comic operas. In the latter he particularly distinguished himself by the novelty, warmth, humor, and liveliness of his ideas, and by a thorough acquaintance with stage effects. Among his 120 operas the most celebrated are: 'Penelope'; 'Gli Orazj e Curiazj'; and 'Artaserse,' among the *opere serie*; and among the *opere buffe*, 'L'Italiano in Londra'; 'L'Amor Costante'; 'Il Pittore Carigino'; and many others. His comic opera, 'Il Matrimonio Segreto,' excited general enthusiasm, and received the signal honor of being performed twice on the same evening, at the desire of the Emperor Leopold. From Vienna he went to Naples, and became involved there in the revolutionary commotions. He died from the effects of the ill treatment which he had been subjected to in prison. His bust, by Canova, was placed in the Pantheon at Rome in 1816 by the side of those of Sacchini and Paisiello.

**Cimbri**, sīm'bri, a tribe which inhabited Jutland (the Chersonesus Cimbrica), whence they sallied, together with the Teutones, and became among the most formidable of the enemies of Rome. In the year 114 B.C., when the Romans were already masters of a part of the eastern Alps, in the present Carniola, Istria, etc., and had established themselves in Dalmatia and Illyria, along the coast, immense bodies of barbarians suddenly made their appearance, who overcame the consul Papirius Carbo in the country now called Styria; but instead of entering Italy they proceeded to the north, and soon after, jointly with the Tigurians, entered the territory of the Allobroges. The Romans sent two armies, commanded by the consuls L. Cassius and M. Aurelius Scaurus, to oppose them, but both were defeated—the former by the Tigurians, the latter by the Cimbri. Even after this success the victors did not enter Italy, but overran Gaul with three bodies, consisting of Teutones, Cimbri, and Ambrones. Two new armies, with which the consul C. Manlius and the proconsul Q. Servilius Cæpio hastened to oppose them, were likewise defeated beyond the Rhodanus. The Romans lost, according to Aetius, 80,000 men. While Rome placed her last hope in Marius, the barbarians

overran the other western countries of Europe. Gaul suffered severely, but the Iberians and Belgians repulsed the invaders. Upon this they resolved to descend into Italy. The Teutones and Ambrones were to enter on the western side of the Alps, the Cimbri and Tigurians on the east. After Marius had waited the approach of the first during three entire years, and had accustomed his troops to their appearance, he routed them completely (102 B.C.) in two days—on the first day the Ambrones, on the second the Teutones—at Aix in Provence. The Cimbri, on the other hand, who had driven back the consul Catallus on the Adige, and had spread themselves along the Po, demanded land of the Romans, but were totally routed by Marius at Vercelli 101 B.C. About a century after this the Cimbri sent (from the Cimbrian Chersonesus) an embassy to the Roman emperor Augustus, to offer him presents and to ask pardon for what they had previously done against the Romans. The nationality of the Cimbri is a disputed point. Similarity of name led the ancients to identify them with the Cimmerians, but this view is no longer held. Some authorities believe them to have been of Germanic, others of Celtic race. Their name certainly has a great resemblance to that of the Celtic Kymri; and their armor and customs, according to Plutarch and Strabo, were very different from those of the Germans. "All these circumstances," says Schmitz, in Smith's 'Dictionary of Greek and Roman Geography,' "render it in the highest degree probable that the Cimbri were a Celtic or Gallic and not a Germanic nation."

**Cim'bian Panic, The**, a Roman panic after the annihilation of five armies by the Cimbrians 105 B.C. This panic rose to its climax after the terrible defeat of Cæpio, the consul in Gallia Narbonensis.

**Cimburgis Lip, The**, often called the "Austrian Lip" (q.v.). It came from Kaiser Maximilian I., and was inherited from his grandmother Cimburgis, a Polish princess, who married Kaiser Friedrich III.

**Cimex Lectularius**, sī'mēks lēc-tū-lār'ē-ūs. See BEDBUG.

**Cimicifuga**, sī-mī-sif'ū-ga, from the Latin, "to drive away," so named because certain species are used to drive away bugs and other insects. The plant is a genus of the crow-foot family, comprising about 20 species, natives of North America, Asia, and Europe. The best known American species, because of their medicinal properties are the bugbane (*Cimicifuga americana*) (q.v.) and the black-snakeroot or black cohosh (*C. racemosa*), supposed to be an antidote for the venom of serpents.

In medicine cimicifuga is used largely by the eclectics as a digestant, cardiac tonic, and uterine stimulant. Its active principles have never been thoroughly determined and little is known of its physiological action as determined by exact pharmacological experiment.

**Cimmerian** (sī-mē-rī'an) **Bos'phorus**, an ancient name for the Strait of Kaffa.

**Cimmerians**, sī-mē-rī-anz, a tribe half-mythical, half-historical, described first in the Odyssey as dwelling beyond the ocean-stream, in thickest gloom, unvisited by Helios. Hence the term, "Cimmerian gloom." From Herodotus we learn that they originally inhabited the coun-

## CIMOLIAN EARTH—CINCHONACEÆ

try between the Borysthenes and the Tanais, but expelled by the Scythians, they traveled along the shores of the Euxine, passed through Colchis and over the Halys, and entered Asia to the west of that river. Against this it is urged that the route by the Euxine would be impassable for a nomadic people, the Caucasus running down to the very shores of that sea. The sum of our certain knowledge respecting this people is, that they seem to have been the chief occupants of the Tauric Chersonesus (the Crimea), where they had a large city, near which were fortifications enclosing the isthmus by an earthen wall.

**Cimolian** (sî-mô'li-ăn) **Earth**, or **Cimolite**, sîm'ô-lit or kim'ô-lit (from Kimolos, one of the Cyclades, in the Ægean Sea, where it is still to be found), a hydrated silicate of aluminum, apparently formed by the decomposition of augite. It is of a light color, compact, and somewhat slaty. Water soon splits it up; when ground with water it forms a thick cream. In classical times it was used as a soap for cleaning delicate fabrics, and by the bath-keepers. It is mentioned by Aristophanes in this connection. It is used in the island as a detergent.

**Cimon**, Athenian general and statesman: b. about 502 B.C.; d. Citium, Cyprus, 449 B.C. He was a son of the great Miltiades. He fought against the Persians in the battle of Salamis 480 B.C., and shared with Aristides the chief command of the fleet sent to Asia to deliver the Greek colonies from the Persian yoke. The return of Aristides to Athens soon after left Cimon at the head of the whole naval force of Greece. He conquered the pirate-island of Scyros, subdued all the cities on the coast of Asia Minor, pursued the Persian fleet up the Euxymedon, destroyed more than 200 of their ships, and then, having landed, on the same day entirely defeated their army 469 B.C. He employed the spoil which he had taken in the embellishment of Athens, and in 463 reduced the revolted Thasians; but the popular leaders, beginning to fear his power, charged him on his return with having been corrupted by the king of Macedon. The charge was dropped, but when Cimon's policy of friendship to the Lacedæmonians ended in the latter insulting the troops sent by Athens to their aid, his opponents secured his banishment. He retired into Bræotia, and his request to be allowed to fight with the Athenians against the Lacedæmonians in 457 at Tanagra was refused by the suspicious generals. Eventually Cimon was recalled at the instance of Pericles to conclude a peace with Lacedæmon. He died while besieging Citium in Cyprus.

**Cinapusen**, sē-nā-poo'san, or **Cinapuran Islands**, a cluster of 10 islands of the Tawi group, Sulu Archipelago, lying southwest of the island of Sulu; area 13 square miles. The islands are covered with tropical vegetation, and are mostly resorted to for fishing by natives of neighboring islands. Tabawan, the largest of the cluster is, however, thickly populated; the inhabitants carry on a considerable pearl fishery. They were at one time notorious pirates, but since the destruction of their settlements by a Spanish fleet, have been harmless

and inoffensive. The islands now belong to the United States and are a part of the Military Department of Mindanao.

**Cinchona Bark**, the bark of several species of *Cinchonaceæ* (q.v.). The following are the most important: *Chinchona flava cortex*, yellow cinchona bark, which occurs as quills covered with a brown epidermis, mottled with whitish yellow lichens, and also in flat cinnamon-colored pieces. They break with a fibrous fracture and the escape of a powder. Yellow bark is rich in quinine, and 100 grains should yield not less than two grains of alkaloid. It is derived from *C. calisaya*, which grows in the peculiar cloudy regions of the Andes. *C. pallide cortex*, pale cinchona bark, from *C. condaminea*. It occurs always in quills covered with crustaceous lichens. Its fracture is short and not fibrous. It contains chiefly cinchonine. Two hundred grains of the bark yield about one grain of alkaloid. *C. succirubra* appears to thrive in India. The bark occurs in flattened rough-fibrous, dark-brown red pieces, which are covered with a brown-red epidermis. It breaks with a red fibrous fracture. It contains about equal quantities of cinchonine and quinine, and 100 grains of the powdered bark should yield not less than 1½ grains of alkaloid. The yellow bark is used in the form of decoction, extract, infusion, and tincture. The pale bark is contained in *tinctura cinchonæ composita* and in *mixture ferri aromatica*. The cinchona barks contain, besides the alkaloids, certain acids having astringent properties, and are valuable as tonics in cases of great debility. Cinchona barks rich in quinine generally contain much lime, and their solutions are precipitated by sodium sulphate. See QUININE.

**Cinchonaceæ**, sîn-kô-nā'sc-ē, a well-marked order of plants, almost exclusively found within the tropics. Its leaves are simple, entire, opposite, with interpetiolar stipules. The flowers are usually arranged in panicles or corymbs. The calyx is adherent, with a definite number of divisions or none. The corolla is superior, tubular, and regular, with a definite number of divisions. The stamens arise from the corolla, all on the same line, and alternate with its segments. The ovary is inferior, surmounted by a disk, usually two-celled, occasionally with several cells; the style is single, inserted, sometimes partly divided; the stigma usually simple, sometimes divided into a number of parts. The fruit is inferior, dividing into halves, or not dividing, and dry or succulent; sometimes it is many-celled. Many of the species of this order are of considerable importance, being largely used in medicine, acting as tonics, febrifuges, emetics, and purgatives. The species of *Chinchona* yield Peruvian bark. An extract, with some sweetness and a more astringent taste than terra japonica, and called by the Malays gambier, is obtained from the *Uncaria gambir*. Ipecacuanha is the root of *Cephaelis ipecacuanha*, a little, creeping-rooted, semi-herbaceous plant, found in the damp forests of Brazil. Coffee is the seeds of a plant of this order, the *Coffea arabica*. A few species bear an edible fruit, such as the genipap of South America, the nahil peach of Sierra Leone, and the voa-vanga, a good dessert fruit in Madagascar. Among dyeing plants there is the

## CINCINNATI

*Oldenlandia umbellata*, whose roots are the chay-root (q.v.) of commerce.

**Cincinnati**, Ohio, county-seat of Hamilton County, in the extreme southwest of the State, one of the great commercial and manufacturing centres of the Union, tenth in nominal rank, and seventh or eighth in fact. It is situated on the north bank of the Ohio River, almost exactly half way from its origin at Pittsburg to its mouth at Cairo, Ill., about 465 miles by water from each and 315 by rail from the former, and 369 from the latter; and is a station on every trunk line of railroad in the Middle West, being the main terminal of the Cincinnati Southern, Cincinnati, Hamilton & Dayton, Chesapeake & Ohio, and a number of others. It is 138 miles by water from Louisville, and 1,631 from New Orleans, against 114 miles and 1,210, respectively, by rail; 764 miles by rail from New York, and 270 miles from Chicago.

**Topography.**—Cincinnati occupies the northern half of a circular amphitheatre of hills about two and a half miles in diameter, bisected east and west by the Ohio River—which here makes a great southward sweep. In the southern half, bisected north and south by the Licking, lie its Kentucky suburbs, respectable cities themselves. The northern semicircle rises from the river in two great terraces, sloping northward to a third level at the summit; originally quite distinct, now much confused by grading. The lower platform is a bluff about 65 feet above low water, the second 50 to 100 feet higher, the crest-hills 150 to 300 feet higher yet, or about 475 feet at the summits—Mount Adams, Mount Lookout, Mount Auburn, Fairview Heights, etc.—giving a noble prospect of river and country. Four of these hills can be reached by inclined plane cable railways used in the main for the lifting of the electric cars. They are cut by ravines, and much of the heavy original woods has been left intact, while the remaining ground has been occupied by miles of the finest residence streets in America, parked with shrubbery, lawns, and flower gardens. On the western side of the city from north to south runs Mill Creek, the remains of a once huge glacial stream, whose gently sloping valley half a mile or more wide, forms an easy path into the heart of the city, and was an indispensable factor in determining its position; highways, canals, and railroads come through it, and the city's growth has pushed much farther up this valley than in other directions. The railroad stock yards are on its eastern slope. Cincinnati extends for about 14 miles along the river front, to a width of about five in an irregular block north from it, but attains a width of six or seven miles at the extreme point along the creek valley. The total area thus far in the city limits is 42½ square miles; much more is legitimately a part of it.

**Municipal Conditions.**—The site of the city is a glacial moraine of gravel and boulders, cut through by the Ohio; there is therefore little bottom land, and has been from the first little of the malaria which was long such a scourge and reproach to western settlements; and this, with the moderate climate, averaging about 75° in summer and 34° in winter, and the easy sewerage down the slopes into the Ohio and away from the city, has given it excellent sanitary conditions, its death-rate falling from 21 per 1,000

in 1890 to 19 in 1900, and 18 at present. The city owns its own waterworks and 449 miles of mains. The water is pumped from the Ohio River into reservoirs in Eden and Third Street Parks, having a capacity of 106,000,000 gallons, the daily consumption being about 44,000,000 gallons. The system is now being extended at an approximate cost of \$10,000,000, and will when completed draw its supply from the Kentucky side of the Ohio opposite California about eight miles up the river and beyond all contaminating sources. The extension includes a complete mechanical filtration plant at the new reservoirs, which will have a capacity of 350,000,000 gallons. With the completion of the new waterworks perfectly pure water will be delivered direct to the consumer. The city has 641 miles of streets, of which 391 miles are paved with macadam, granite, asphalt, etc.

**Interior, Suburbs, etc.**—The bottom level below the bluffs, along the riverside, is of course the seat of the river shipping business, and has as well the usual fringe of low quarters; it is paved and there is a broad "public landing" fronted by floating docks, wharf-boats, etc. Above are the wholesale and then the retail business streets, with great extent and variety of fine business architecture, and gridironed with electric roads, of which there are some 225 miles within the city limits. The principal lines converge at or near Fountain Square (see below), and connect with a ring of beautiful suburbs, within and without the city limits, unsurpassed in America. To the north are Clifton, Avondale, Mount Auburn, Vernonville, College Hill, Winton Place, Linwood, Elmwood, Hartwell, Lockland, Glendale, Norwood, Oakley, Walnut Hills, Mount Lookout, etc.; across the river, over which, on three bridges, the electric lines run, are numerous cities and towns, including Covington, Ludlow, and Milldale to the west of the Licking, and Newport, Bellevue, Dayton, and, far beyond, to the east, Fort Thomas, a leading army post. The section lying to the north and east of the canal which intersects the plateau at the foot of the suburban hills is largely occupied by Germans, from which circumstance it is frequently referred to as "over the Rhine." The river is crossed by five bridges, each more than half a mile long, one exclusively for railway traffic, two for highway, and two for both; the truss-bridge of the Cincinnati Southern to Ludlow—costing \$3,348,675, with one of the longest spans in the world—the cantilever of the Chesapeake & Ohio to West Covington; the great wire suspension bridge to Covington, designed by John A. Roebling, and completed in 1867 at a cost of \$1,800,000, and two wrought-iron bridges to Newport, one of them used by the Louisville & Nashville R.R.

The original town was laid out as a checker-board, with streets four rods wide, the conventional form of the artificial American town; but the irregular surface and individual tastes have given them greater variety since, and no city has a finer field for picturesque architecture. The older residence streets were monotonous rows of low brick houses, but the newer ones have a remarkable variety both of form and material. A local freestone and blue limestone are much used in building, as well as brick with steel framing. The most notable public buildings, besides churches mentioned below, are the gov-

## CINCINNATI

ernment building (post-office, custom-house, etc.) of brick and iron with sawed freestone facing, 180 feet by 50, and costing \$5,200,000; the county court-house (Romanesque), replacing the one destroyed by the mob in 1884, with the jail in the rear, the whole occupying an entire square; the beautiful city-hall, completed in 1893 at a cost of \$1,266,956.10; the city hospital, of eight buildings around a central court, occupying a square of nearly four acres, and costing over \$700,000 exclusive of grounds; the city work-house, the university buildings, the Chamber of Commerce, one of H. H. Richardson's last designs; the magnificent Music Hall, the gift of Reuben R. Springer and others; the Romanesque public library, costing \$675,000; the Masonic Temple (Byzantine), Odd Fellows' Temple, Y. M. C. A. Building, Art Museum, the Queen City, Cincinnati and Phoenix clubs, Lafayette and Third National Bank buildings, Rookwood Pottery, St. Francis Xavier's College, a splendid structure; the Central Union depot, the city markets, and the sky-scrapers of 15 to 20 stories, one of which, the Ingalls Building, is the tallest concrete structure in the world, as well as smaller but admirable bank and other business buildings. Of public monuments, by far the most artistic is the Tyler-Davidson Fountain, with a surrounding esplanade, on Fifth Street, between Vine and Walnut, in Fountain Square, the centre of most of the street car lines. It was presented to the city by Henry Probasco in 1871, having been cast at the Royal Foundry in Munich at a cost of \$200,000, and is regarded as the finest fountain in the world, and one of the world's chief art treasures. The equestrian statue of President William Henry Harrison (first governor of Ohio), the statues of Garfield, Lincoln, Hecker and McCook, and the Fort Washington monument also adorn the city.

*Parks, Cemeteries, etc.*—The park system comprises 540 acres, in three large bodies on the hills and seven smaller ones. The largest is the superb Eden Park, containing 210 acres, on Mount Adams in the northeast centre, containing the two main city reservoirs made to look like lovely natural lakes; there is also a high water tower with steps to the top, commanding a matchless prospect. The Art Museum and Art School, the gift of C. W. West, Joseph Longworth, David Sinton, R. R. Springer, and others, two beautiful buildings costing \$450,000, is within the grounds, which are entered by a mediæval gateway, Elsinore, much admired. The next largest park, and equally picturesque, is Burnet Woods in the north centre, with about 160 acres; it contains the grounds, 30 acres in extent, of the University of Cincinnati (q.v.), and another exquisite lake. The zoological gardens, north-east of Burnet Woods, with 60 acres of wild natural beauty, is the home of a varied collection of wild animals and birds, regarded as the best in the country. Lincoln, Washington, and Hopkins are the finest of the smaller parks. Most of the 20 cemeteries are in the northeast, though one or two are in the extreme southwest; but the one superb burial ground, one of the largest and most charming in the country, is Spring Grove Cemetery, about six miles north on the western slope of Mill Creek Valley, with 600 acres of fine landscape gardening and native beauty, and reached by an avenue 100 feet wide. It has a bronze statue as a soldiers' monument,

and a number of magnificent and costly mausoleums.

*Amusements, Clubs, etc.*—Cincinnati's large German population, with the healthy taste of that element both for recreation and music, has given it a foremost place in these lines. Music is cultivated in a number of well patronized institutions, the College of Music and the various conservatories, and the biennial May festivals are an indispensable part of the city's higher life and are known throughout the world. Other important features of the musical life are the permanent symphony orchestra, the Apollo and Orpheus clubs and a large number of German singing societies. The grand Music Hall is a monument of the munificence of Reuben Springer, who founded it and gave part of its endowment; it is 500 feet by 300, has a seating capacity of over 4,000, and its organ is one of the largest in the country. There are also the Grand, Robinson's, and Heuck's Opera houses; the Walnut Street, Columbia, Lyceum, and People's theatres, the Auditorium, College and Greenwood halls, the Turner and Arbeiter halls, etc. The chief clubs are the Queen City, Business Men's, Phoenix, Cincinnati, Cuvier, Country, Commercial, and Literary. The Cincinnati Gymnasium has extensive suburban athletic grounds and owns a fine city building. There are two favorite summer resorts on the Ohio, one on the Kentucky shore called the Lagoon, and Coney Island, some miles up the river. Chester Park, near Spring Grove Cemetery, is also a well-equipped resort.

*Business Interests.*—The position of Cincinnati as a midway port on the great central channel of one of the most fertile districts of the world, added to its location on a platform above the floods which washed away its rivals, was the origin of its greatness; but that river traffic has greatly declined since the advent of railroads. Even yet, however, it is invaluable for the transportation of bulky freight—coal, ore, iron, lumber, salt, etc.—to manufactories, and the distribution of its products to the Ohio and Mississippi and their tributaries. A number of regular packet lines still run to Louisville and the Mississippi ports as far as New Orleans, up the Ohio to Pittsburg, to the Big Sandy, Cumberland, Tennessee, and Green, the Red, White, Arkansas, Yazoo, etc., covering 1,200 miles of the Ohio, 850 of the Mississippi, and 2,000 of tributaries. About 100 vessels a year register for this inland commerce, with a tonnage of some 18,000; but there is a much greater commerce than this indicates, as one towboat will push many barges in front of it, a method peculiar to western rivers. The government improvements, dredging and lighting the channel, have greatly aided to keep this navigation alive. Furthermore, by the Miami Canal to Lake Erie at Toledo, much heavy raw material is still brought in at rates the railroads cannot meet. The immense railroad business has already been referred to. Sixteen roads enter Cincinnati; the passengers of most of them come into the Central Union Depot at Central Avenue and Third Street; but a few, of which the Pennsylvania, and Cincinnati, Hamilton & Dayton are chief, have separate stations. The Cincinnati Southern road, 338 miles long, was built and is still owned by the city, and is operated by the Queen & Crescent route under lease.

## CINCINNATI

The trade and manufacturing interests of the city are enormous, even beyond the proportion of its size. It has 13 national banks, clearings aggregated \$1,154,647,600 for 1903. It has also a number of State and private banks. The building and loan associations, which had grown to number 309 in 1902, are being largely absorbed by new and strong trust companies and savings banks. The slaughtering and packing of meats, especially pork, has long been and is still one of the leading branches of commerce, the city packing more than half the meat product of the State. Cincinnati holds the first position in this country in sales of pig-iron, the total yearly receipts and sales for direct shipment amounting annually to nearly \$50,000,000. The number of industrial establishments is about 8,000, employing a capital of about \$135,000,000, and 110,000 workmen, and occupying real estate valued at \$65,000,000, with an annual product of \$315,000,000. The value of commodities received (latest estimate of Chamber of Commerce) was \$545,000,000, while the value of the principal commodities shipped was \$505,061,615. According to the census of 1900, the greatest single branch is iron work, including pig, castings, foundry and machine-shop products, and architectural iron work, \$12,384,848; others, men's clothing (factory-made), \$11,950,648; slaughtering and meat packing, wholesale, \$9,532,057; distilled liquors, \$9,419,087; factory-made boots and shoes, \$8,788,424; carriages and wagons, and their material, \$7,233,048; tobacco products, \$6,768,407; malt liquors, \$6,387,383. Other great products are leather and leather goods; furniture, lumber, timber, and woodworking products; coffee and spices, roasted and ground; saddlery and harness; pickles and preserves; undertakers' goods; musical instruments; soap and candles; electrical supplies; flour and grist; plumbers' supplies; patent medicines; and society regalia, costumes, banners, etc., in which Cincinnati heads the United States. Other products number hundreds, many curious and interesting.

*Educational Institutions, Libraries, Newspapers, etc.*—Cincinnati has a thorough system of public schools, with 52 grammar schools (including one for deaf-mutes), and three public high schools, the Hughes, Walnut Hills, and Woodward; with about 850 teachers; and 15 private academies and secondary schools, besides several score of Catholic parochial schools. For higher education, the chief is the University of Cincinnati, expanded from the old McMicken University, the capstone of the system of public instruction, with affiliated law, medical, and dental departments, and in connection the famous observatory now located on Mount Lookout—one of the earliest in the United States, with an 11-inch refractor and a new meridian circle, and with a notable record in the investigation of double stars. The university buildings are in a 30-acre space set off by the city in Burnet Woods Park. The Ohio Mechanics' Institute, one of the most important educational forces in the city, has a large, thoroughly equipped building and library, and maintains both day and night schools, attended by hundreds, in which regular classical, literary, and scientific instruction and courses of lectures are given. There are also half a dozen medical and surgical schools, besides training schools for nurses in the hospitals; two other dental colleges; a night law school; sev-

eral business colleges and schools of expression; Lane Theological Seminary at Walnut Hills (1832), famous for Lyman Beecher and Calvin E. Stowe, and for its slavery dissensions; two Roman Catholic colleges, St. Francis Xavier (1840), and St. Joseph's (1873); 5 Catholic seminaries for the education of priests, and 6 Catholic female academies and seminaries, leading to orders; the Hebrew Union College for educating rabbis, the chief one in the United States; the Art Museum and Art School founded by Cincinnati ladies on the model of South Kensington, with two large buildings and several hundred students, and a valuable collection of works of art. The Cincinnati Society of Natural History has a museum of valuable and interesting relics open to the public. Of the libraries, the chief is the free Public Library, handsomely housed on Vine Street (with over 300,000 volumes and pamphlets), and various suburban branches. There are 16 others, subscription and institutional, of which the chief are the Young Men's Mercantile, the Law Library, that of the Mechanics' Institute, the library of St. Xavier's College, Lloyd Library and Museum, the University Library, and the Historical and Philosophical Society has the finest collection in existence of original manuscripts, pamphlets, and bound volumes, pertaining to the history of Cincinnati and the State of Ohio, and ranks among the first institutions of the kind in the country. There are in 1904, 19 daily newspapers, 12 English, 6 German, and one Italian; 70 English and 13 German weeklies; 79 monthlies, 23 quarterlies, and 14 of various other kinds, 220 periodicals in all.

*Churches and Charities.*—Cincinnati in 1903 had 269 church bodies, 60 Roman Catholic (besides five convents), 180 Protestant of various denominations, 12 Jewish synagogues, and 17 unclassified, including Christian Science, Spiritualist, etc. The city is the seat of a Roman Catholic archbishop and a Protestant Episcopal bishop, with cathedrals of both. The finest church building in Cincinnati is the cathedral of the former (St. Peter's), in pure Grecian style, 180 feet by 60 and 90, with a spire 224 feet high. Other prominent churches are the First Presbyterian, with a tower and spire 285 feet high, the loftiest in the West, surmounted by a gilt hand pointing upward; the Second Presbyterian; St. Francis Xavier and the St. Francis de Sales (Roman Catholic) on Walnut Hills (with the largest swinging bell in the world); the Hebrew Synagogue and the Temple; Christ's and St. Paul's Protestant Episcopal, and St. Paul's Methodist Episcopal; the Ninth Street Baptist; the Unitarian; and the Church of the New Jerusalem (Swedenborgian).

There are 53 benevolent associations in the city, covering every class and grade of alleviable human misfortune; an infirmary; a house of refuge for irreclaimable children; and a workhouse, with workshops and work grounds. Prominent among the 17 hospitals, public and private, are the large city hospital, the Jewish Hospital, Good Samaritan, St. Mary's (both Catholic), Longview Asylum, United States Marine, Bethesda, the Ohio Hospital for Women and Children, the Presbyterian, the Elizabeth Gamble Deaconess Home and Christ Hospital, and the Laura McDonald Memorial. There are also numerous homes for the aged and infirm, for

## CINCINNATI

orphans, for incurables, and the friendless, non-sectarian, and denominational, all splendidly equipped, and a fresh-air fund and farm.

*Government, Finances, etc.*—The government is "federal"; there is a two-years' mayor, who appoints non-partisan election, supervisory, and public safety boards (in control of the fire and police departments); a (legislative) council of one from each ward; other boards and officers elected by the people, including an administrative board of public service, and a board of education. The city debt is about \$25,000,000, but \$18,000,000 of this is for the Cincinnati Southern line, which returns \$1,000,000 a year rental. The tax-rate is \$22.70 per \$1,000. The yearly disbursements are about \$7,000,000, of which over \$1,000,000 is for schools.

*Population.*—In 1800, 750; 1810, 2,540; 1820, 9,642; 1830, 24,831; 1840, 40,338; 1850, 115,435; 1860, 161,044; 1870, 216,239; 1880, 255,139; 1890, 296,908; 1900, 325,902. The census bureau estimate for 1904 is 332,934, which obviously does not include the territory annexed to the city in March 1904. This does not convey accurate information, however, without supplemental figures based on the position of the city with nearly a third of its business population resident across the river in another State, as well as several populous suburbs in other townships to the north. Newport, Bellevue, and Dayton, Ky., east of the Licking, contained in 1900 40,761; Covington and Ludlow, west of it, 49,989, or 90,750 in Kentucky; while Mill Creek and Columbia on the north had 34,629—a grand total of 451,281.

*History.*—The site of Cincinnati at the time it first came under the eye of the white man was covered with "ancient works," monuments of a prehistoric race. Traces of many of these "works" still abound in the neighborhood, which is a centre of the so-called "Mound Builders" remains. Here, too, ran the old Indian trail leading from the British trading post at Detroit to the Licking River, and into the section south of the Ohio. Numerous bands of savages swept through the valley of the Miamis, subsequently called the "Miami Slaughter House," on their marauding expeditions against the Kentucky pioneers. It was in pursuing one of these bands of "horse thieves" that Benjamin Stites first noticed the fertility of the section and its desirability for settlement. As a result of his efforts came the "Miami Purchase."

John Cleves Symmes, with other members of Congress who had been interested by Stites, in 1787 began negotiations with the government for the land lying between the Miamis, which resulted in a conditional purchase that on survey proved to be some 600,000 acres, of which he ultimately received about half. Early in 1788 he sold 740 acres opposite the mouth of the Licking to Matthias Denman and others, with whom he visited the spot later and selected it as the site for a city, to be called Losantiville—a combination of Latin and French, meaning "town opposite the mouth of the Licking." After some shiftings of ownership, a firm consisting of Israel Ludlow, a surveyor, and two others, took possession 28 Dec. 1788, and Ludlow laid out a village with the present Central Avenue and Broadway, about three quarters of a mile apart, for east and west boundaries, and Seventh Street, about as far from the river, for

northern, blazing the street lines on the trees. Three or four log-cabins were built, and the flooding out of several Ohio River town sites about this time left Cincinnati the chief survivor. The building of Fort Washington by the government in the summer of 1789, just east of Broadway, still further confirmed its primacy, for the Indians were a terrible menace until long after. In January 1790, General Arthur St. Clair, newly appointed governor of Northwest Territory, arrived, laid out Hamilton County (named after Alexander Hamilton), and made its seat the new town, whose name he changed to Cincinnati (Symmes, who professes to have suggested the change, was tenacious for Cincinnati), after the famous society of Revolutionary officers, of which he was a member. By the end of 1790, it had some 40 log-houses. The defeats of Harmar (1790) and St. Clair (1791) nearly caused its abandonment in a panic, but the importance of the fort kept the settlement alive. In 1792 as many as 354 lots had been taken for building; and so important a centre of commerce had it become even then that 34 of its buildings were warehouses well stocked with goods. It had some 900 inhabitants, but many of them were floaters. A visiting missionary reported that the people resembled those of Sodom, and the town, like others on the north bank of the Ohio, was thronged with frontier idlers and lawless ruffians who took refuge in Kentucky when brought to book; but as the first church (Presbyterian) was built this year, and the first school (pay) opened with 30 scholars, perhaps some of this language was "common form." Also as settlers were compelled by law to take their loaded guns to church for protection against Indians, it was no place for the tamer sort. In 1793, the 'Centinel of the Northwest Territory,' the first newspaper published north of the Ohio, appeared, and a year later the first through mail to Pittsburg was started in a canoe, and a packet line of keel boats to Pittsburg was organized. Wayne's crushing defeat of the savages at Fallen Timbers, bringing peace to the frontier, was in one sense disastrous to Fort Washington, as settlers swarmed all over Ohio, and it ceased to be the one centre. This defeat, however, assured the permanency of Cincinnati, which increased slowly but surely until in 1800 its population was 750, a growth of 50 per cent since 1795. In December 1801 the seat of territorial government was removed to Chillicothe. But its 12 years' primacy, the army post making it a depot for supplies, and its frontier position, had given it a safe start. In 1802 Cincinnati was incorporated as a town. A well-known picture of the town also dates from this year, in which, too, a "Young Ladies' School" was started, indicating a superior grade of population; and from February to May 1802 over 4,400 barrels of flour were exported, showing its development as a distributing port. The first bank, that of the Miami Exporting Company, was started in 1803. In 1805 the town had 960 people and 172 buildings. But immigration set in much more strongly a year later, and the names show an extraordinary intellectual calibre in the settlers it was attracting. In 1810 it had 2,300 inhabitants, and was the largest town in the State, the centre of immigration to Ohio, and with a great commerce along the river, and was contemplating a university. The first book de-

## CINCINNATI

scriptive of the place appeared this year written by the celebrated Dr. Drake. In October 1811 the New Orleans (steamboat) passed the town on her first trip from Pittsburg to Louisville. A stone steam mill 110 feet high of nine stories and with foundation walls 10 feet thick, dates from 1812. In 1814 Lancaster Academy, afterward Cincinnati College, was founded. In 1819 the town received a city charter, having according to the first directory, published this year, 9,873 inhabitants, mostly from the Northern and Middle States, but also many foreigners, so that it was "not uncommon to hear three or four languages spoken in the streets." Another little book descriptive of the city published in 1826 was republished in England and, translated into German, circulated on the continent and attracted a large number of immigrants, especially Germans, who by 1840 numbered one fourth of the population. But its great development came with the opening of the Miami Canal, the most important single influence in the history of the city, for which ground was broken in 1825 at Middletown, and which was completed to Cincinnati in 1827. This not only developed commerce, but furnished great waterpower for manufacturing. The first railroad, the Little Miami, was chartered in 1836, but was not opened till 1846, the first section not till 1843. Even before this the growth was very rapid, population nearly trebling 1820-30, and nearly doubling 1830-40; but the next decade showed the tremendous leap from 46,000 to 115,000. From 1840 the immense immigration of Germans increased so rapidly as to make it for years the typical German city, and this element still constitutes a large proportion of the population. The Germans took great interest in grape culture, and "the banks of the beautiful river" were festooned with vines and the city for some years was a great wine market. It was the great German population that caused the first Saengerfest of the North American Saengerbund to be held here in 1849, a great stimulus to the musical activity of a city since so famed in the musical world. Several times the city was fearfully ravaged by the cholera, beginning with 1832-4; in 1849 and 1850 over 9,000 souls, or nearly 8 per cent of the entire population, perished of it. Yellow fever came in 1878. Floods have also risen over its platform several times and laid the lower section under water; those of 1832 ("the year of flood, fire, pestilence, and famine"), 1883, 1884, having been especially high and destructive. In 1838 the new and beautiful steamer *Moselle* exploded in front of the landing with a loss of almost a hundred and forty lives, one of the most terrible river disasters of the country. Two years later the city was the centre of the "log-cabin" campaign, which sent a favorite son, William Henry Harrison, to the White House. At a later time Hayes, whose previous active life had been spent in this city, occupied the Presidential position, and Salmon P. Chase, another famous Cincinnati, was Chief Justice of the United States. A continuous excitement of the city was its fury over the race question and later the abolition movement. The vast Northern interest in Southern trade was everywhere a powerful restraining influence on this; but Cincinnati, on the border, and with its daily bread dependent on this trade, besides having a considerable percentage of its people of Southern birth

and detesting the movement on general principles, felt menaced with entire industrial ruin if the agitation were not put down by force. Lane Seminary was threatened with fire, and its faculty with lynching if the students were not prohibited from discussing slavery; and in 1836 and 1841 James G. Birney's Philanthropist press was wrecked by the mob. In fact anti-negro riots were frequent and arose upon the slightest provocation. The trouble was later aggravated by the fact that Cincinnati, being a border city, was a chief station on the "Underground Railroad"; one Quaker citizen boasted of aiding 3,000 fugitive slaves to escape, and in all several times that number must have been smuggled across. Here, too, were tried the celebrated "fugitive slave cases," the Rosetta and Margaret Garner cases. In 1856 Buchanan was nominated for the presidency in Cincinnati; later nominees of Cincinnati conventions were Greeley in 1872, Hayes in 1876, and Hancock in 1880. When the war broke out, however, it became a strong Union city, and its record is noble. In 1862 the fear of an assault by the Confederate, Kirby Smith, caused it to be put under martial law for awhile; a somewhat similar experience came in 1864 at the time of the John Morgan raid. Another war incident was the Vallandigham case. Cincinnati sent its citizen, George B. McClellan, to command the armies of the North. The decade prior to the war had not been one of great progress, but in spite of the decay of trade with the South, the city leaped forward with the resumption of peace. The desire to renew the relations with its old business associates induced it to enter upon the construction of the Cincinnati Southern Railway to Chattanooga, which was built by the city itself, an extreme instance of municipal ownership. The celebrated "Bible" case in 1869 resulted in the abolition of religious instruction from the public schools and gave national fame to the bar that included such lawyers as those who argued the case. In 1869 began a series of annexations, which in a few years increased the city area from 7 square miles (3 when incorporated in 1819) to 24 square miles. Annexations in 1895 and 1903-4 have brought the area to 42½ square miles. The most notorious event in its later history is the "Cincinnati Riot" of 28-31 March 1884. As usual in modern times, the law had protected the criminal against the community till the criminal law was felt to be a farce; some murderers had received absurdly light sentences, and the patience of the lower orders gave way; they attempted to break into the jail and lynch the prisoners; foiled in this, they assaulted the court-house, and burned it, as well as its records and other buildings adjoining; the State militia had to be called in, and in the fray that ensued 45 persons were killed and 145 wounded. In 1888 the centenary of the settlement of the State and city was celebrated by a Centennial Exposition of the Ohio Valley, the culmination of a series of industrial expositions that had attracted the attention of the country and given a director-general to the Centennial at Philadelphia in 1876.

cinnati' (1815); Drake and Mansfield, 'Cincinnati in 1826'; Cist, 'Cincinnati in 1841'; 'Cincinnati in 1851'; 'Cincinnati in 1859'; 'Cincinnati Miscellany' (1844-5); Stevens, 'Cincinnati' (1869); Burnet, 'Notes on Northwest Territory' (1845); Mansfield, 'Personal Memories, 1803-1843'; Directories of 1819, 1825, and 1829; and Mrs. Trollope, 'Domestic Manners of the Americans.' JUDSON HARMON,

*Ex-Attorney-General United States.*

**Cincinnati Anticline.** In the period of disturbance which marked the close of Ordovician time in North America, the limestones deposited during the Trenton Epoch in the interior sea that covered most of what is now the Mississippi Valley were forced up, on a line running through southern Ohio, Kentucky, and Tennessee, in a low, broad arch. This arch is called the Cincinnati Anticline. It has been of much economic importance from its having contained great reservoirs of petroleum and natural gas, the latter now approaching exhaustion. See ORDOVICIAN SYSTEM; TRENTON EPOCH.

**Cincinnati, Society of the** (as having left the plow, like Cincinnati, for their country's service, and returning to it when the need was over): a memorial society organized by the officers of the American Revolutionary army, 13 May 1783, just before their final dispersion, from the camp on the Hudson near Fishkill. The first meeting was in the Verplanck House, Steuben's headquarters. A society was organized for each State, besides the general society of which Washington was elected president. Membership was confined to officers of the Continental army who had served with honor three years, or been honorably discharged for disability, whether native or foreign, and to their direct male descendants in order of birth, through females in default of males, and then to collaterals if judged acceptable to the society. Partly as including several European nobles (Lafayette, Steuben, etc.), this was considered the beginning of an aristocratic order on European models, obnoxious to popular liberties. Of course it could only become such by government recognition, but the principle of heredity is *per se* un-American. With more show of reason, it was regarded as a military conspiracy to appropriate all the offices under the new government; a sign that the officers did not intend to be Cincinnatiates if they could help it. It was regarded by high and low as a grave public danger; and all the Revolutionary chiefs who had not been in the army, and were ineligible,—Franklin, Adams, Jefferson, etc.—distrusted its possibilities if not its motives. The legislatures of Massachusetts, Rhode Island, and Pennsylvania adopted resolutions censuring it as dangerous to the liberty and safety of the country; the governor of South Carolina denounced it in his message to the legislature; and the Irish chief justice of the same State, Ædanus Burke, wrote a pamphlet signed "Cassius," proving that it would subvert everything gained by the Revolution. This pamphlet was translated into French, and used by Mirabeau some years later. At the first general meeting, 7 May 1784, Washington persuaded them, in view of this public excitement, to abolish this hereditary feature. This, however, did not wholly conciliate popular feeling; and in 1789 the Tammany Society was

founded in New York in avowed opposition, as a body where true equality should govern, and private advantage should not prevail over disinterested public spirit.

In 1787 Washington was elected president-general, and re-elected till his death; Alexander Hamilton succeeded him. Most of the State societies soon died, and the general society languished. When Lafayette visited this country in 1824, he was the only surviving major-general. The old hero's reappearance galvanized it into new life for a short time, but it sank out of sight again, and for many years was virtually dead, its chief function being an annual dinner in New York. Even a nominal organization was retained only in three or four States. The last survivor of the original association was Robert Burnet of New York, who died in 1854. In 1893 the general society began a successful effort to induce the States to revive or re-form their branches, and Connecticut first (1893) and Georgia last (1902) fill up the roll of the 13. Some of them issue publications.

The president-generals of the society have been: George Washington, Alexander Hamilton, Charles Cotesworth Pinckney, Thomas Pinckney, Aaron Ogden, Morgan Lewis, William Popham, H. A. S. Dearborn, Hamilton Fish, William Wayne, and Winslow Warren.

The emblem of the society, adopted at the outset, was a bald eagle suspended by a dark-blue ribbon with white borders, symbolizing the union of France and America. On the eagle's breast is Cincinnati receiving a sword and other military insignia from the senate; in the background, his wife stands at the door of their cottage, with the plow and other agricultural implements near; round the whole are the words, *Omnia reliquit servare rempublicam* ("He left all to serve the commonwealth"). On the reverse, Fame is crowning Cincinnati with a wreath, inscribed *Virtutis Præmium*; in the background, a seaport city with gates opened and vessels entering; below this are joined hands supporting a heart inscribed *Esto Perpetua* ("Be thou perpetual").

**Cincinnati, University of.** The University of Cincinnati owes its existence primarily to a bequest of Charles McMicken, who, in 1858, left \$1,000,000 worth of property to the city of Cincinnati to found and maintain a college. One half of this property consisting of real estate in the State of Louisiana was lost in 1860 by a decree of the Supreme Court of the United States, annulling that section of McMicken's will giving this property to the university on the ground that the testator could not bequeath real estate in Louisiana to a foreign corporation. The university receives support from the city to the extent of  $\frac{1}{80}$  of a mill on the total city tax. Other gifts have been utilized to contract buildings and to increase the endowment fund. The total value of the property and endowment was \$2,260,761 in 1904. From 1858 to 1874 the income from McMicken's estate not being sufficient to support a college or university, the trustees decided to wait until a fund should accumulate or until additional support could be gained. Thus the present University of Cincinnati was not founded until 1874, although three departments of the university are much older, namely, the Astronomical Department, founded in 1842;

## CINCINNATUS — CINEMATOGRAPH

the Medical Department, founded in 1819; the Law Department, founded in 1819 (Cincinnati College). Until 1899 the University was composed of the following departments: Medical (founded 1819); Law (1819); Astronomical (1842); Academic (1874). Since 1899 the following departments have been added: the College of Engineering, offering courses in civil, electrical, chemical, architectural, and hydraulic engineering; the University Summer School; the University Library; the Teachers' College; the University Press; and the Technical School, which furnishes the shops to the Engineering Department, and is an integral part of the Teachers' College. The reorganization was effected under the presidency of Howard Ayers, LL.D. The Dental Department and the Clinical and Pathological School are only affiliated with the University of Cincinnati, having no financial or other connection with the University. The following scholarships are awarded to students of this university according to merit: the C. G. Comegys scholarship with an annual stipend of \$50; five University scholarships with an annual stipend of \$75; five McMicken honorary scholarships; twelve Thoms scholarships; the D. A. R. fellowship in American History established by the local chapter of D. A. R., with an annual stipend of \$200. No tuition is charged to residents of the city of Cincinnati who enter the university as students. All others who enter the Academic Department are charged a tuition of \$75 per year. The professional schools charge from \$75 to \$125 annual tuition. The University of Cincinnati possesses a beautiful location in Burnet Woods Park, away from the noise and dirt of the city. Its government is by a board of directors appointed for six years by the mayor of Cincinnati. The intellectual life of the University finds expression in the publication of many memoirs, and monographs on literary and scientific subjects through the very important department of the University that has been recently established, namely, the University Press. These contributions to knowledge in the form of an annual volume of university bulletins are distributed by exchange all over the world. The total number of laboratories in the University is 35 in 1904; the total number of volumes in the University Library, including pamphlets, is 143,463. The teaching corps numbers 156, and the students 1,360.

HOWARD AYERS, LL.D.,

*President of the University of Cincinnati.*

**Cincinnatus**, sîn-sîn-nā'tūs, **Lucius Quinctius**, a patrician belonging to the earliest period of the Roman republic: b. about 519 B.C. The legend which makes him the beau-ideal of the virtuous Roman is as follows: The Romans of his day were weakened by dissensions between the patricians and plebeians; the war-like Æquians, after making harassing incursions into their territory, succeeded at last in surrounding the Roman army under the consul Minucius in the wooded grounds of Mount Algidus. In despair the Roman senators went to Cincinnatus, offering him the dictatorship. The messengers found him at the plow. Reluctantly he accepted the office. He succeeded in rescuing the army from its perilous position, and marched to Rome laden with the spoils of victory. He then returned to his farm, whence

he was again called at the age of 80, to resume the dictatorship, to oppose the machinations of Spurius Mælius, and prevent a civil war between the upper and lower classes, which he succeeded in doing.

**Cinematograph**, sîn-ē-măt'ō-grăf (Gr. κίνημα, "movement," from κινέω, "to move"), an ingenious instrument introduced about 1895 by two brothers Lumière of Lyons, and founded on the same principle as Edison's kineoscope. The most important part of the instrument is a sensitive photographic film or band about an inch and a quarter broad and about 50 feet long. This band passes over a drum of moderate size, then down and round a small one, which deflects it upward toward another small drum, and after passing over this one it winds round another large drum in the centre of the instrument proper. Each portion of the film in the course of its motion passes vertically close behind an opening situated above the last three drums, but below the first one. This opening does not communicate directly with the outside, but is placed in the partition dividing the part of the apparatus containing the last three drums from an adjacent part situated below that containing the first drum. Facing this aperture, and fixed in the opposite wall of that box which does not contain the three drums, is an objective through which light passes into the interior. Thus, by means of a peculiar arrangement of eccentrics which secures that each portion of the film shall be stopped for an instant before the opening, about 15 photographs per second can be received on the film, each representing the photographed group at a different instant from the others. In order to transform these negatives into positives, the negative film is rolled back on to the first drum, and on a second similar drum below it in the same compartment of the apparatus another film is rolled. The two films are then unrolled simultaneously, and thus the light entering through the objective and the aperture imprints on the new film a positive impression of the scenes represented on the other one. The positive film is made to wrap itself round the drum in the lower part of the apparatus, while the negative one is made to pass off through the bottom. The positive film is now wound back onto the first drum, and the instrument is then ready to project the representations on a screen at some distance. To do this, lantern accessories are necessary, but beyond that all that is required is to unwind the positive film by means of the same mechanism as performed the previous operations. The screen receives enlarged representations of the successive film-photographs in the same order as that of taking, and separated by such small intervals of time as to cause the whole to blend and form apparently a continuous representation of a moving group during a fairly long period of time. The advantages of this mode of photographing and throwing pictures on a screen over the older methods are obvious. Movements too rapid to be analyzed by the eye can, by controlling the rate of working while they are being represented on the screen, be made slow enough to permit of their true nature being observed; and, similarly, movements too slow for comprehension or rapid observation may often be, as it were, quickened.

■  
CINCINNATI.

1. Fountain Square; Tyler-Davidson Fountain.

2. University of Cincinnati Buildings.

## CINERARY URNS — CINNAMON

**Cinerary** (sîn'ê-râ-rî) **Urns**, urns in which the ashes of the dead were deposited after the body was burned. Many Greek and Roman urns are in a high style of art, and are formed of bronze, marble, glass, or pottery ware. See BURIAL.

**Cingalese.** See SINGHALESE.

**Cinna**, sîn'a, **Lucius Cornelius**, Roman patrician, associate of Marius, and leader of the popular party, during the absence of Sulla in the East. In 86 B.C. he was elected consul along with Octavius, and in violation of his oath to Sulla, he attempted to overpower the senate and to procure the recall of Marius and his party from banishment. In the contest which ensued, he was defeated by his colleague and driven from the city. His office thus became vacant, and the senate appointed another consul in his stead. He soon returned, however, along with Marius, and laid siege to Rome. The senate was forced to capitulate; but while the votes of the people were being taken for the repeal of the sentence against Marius, he broke into the city, massacred the friends of Sulla, and allowed his partisans to commit frightful excesses. He was consul for the next three years; but Sulla, having brought the Mithridatic war to a close, resolved (84 B.C.) to return to Italy to inflict condign punishment on his enemies. Cinna prepared to resist him by force of arms, but was prematurely slain by a mutiny among his own troops.

**Cinnabar**, sîn'na-bâr, red sulphide of mercury, HgS. The native cinnabar occurs in earthy, granular, and massive forms, and also in crystals belonging to the rhombohedral system. It is red, not infrequently with a brownish or leaden cast. Its hardness is from 2 to 2.5, and its specific gravity from 8.0 to 8.2. Artificial cinnabar, formed by subliming a mixture of sulphur and mercury, is brighter in color than the native mineral, probably on account of its greater purity, and is known in commerce as "vermilion." Cinnabar is the principal ore of mercury, and large deposits of it occur at Almaden, Spain, at Idria in Carniola, at New Almaden, Cal., and in certain parts of China and Japan. When it is roasted the sulphur burns away, and metallic mercury distils off and is condensed in earthenware vessels. (For a discussion of various ancient references to cinnabar, see 'Engineering and Mining Journal,' 16 May 1903, p. 747.)

**Cinnamic** (sîn'a-mîk) **Acid**, an acid which exists in the free state in the balsams of tolu and Peru, in liquid storax, and in gum benzoin. When oil of cinnamon is exposed to the air it absorbs oxygen and deposits crystals of cinnamic acid, which are colorless, and readily soluble in alcohol, ether, and boiling water, but sparingly soluble in cold water. It is not of any importance in the arts and is chiefly interesting as being the acid corresponding to oil of cinnamon. This oil is the aldehyde of cinnamic acid, and is represented by the formula  $C_9H_8O$ . Though isomeric with oil of cassia it has a slightly different flavor, and is much more expensive. Both of these oils are employed in medicine as aromatic stimulants, but chiefly as pleasant adjuncts to disguise the taste of nauseous drugs. From a chemical point of view, the cinnamic acid and oil of cinnamon are related to benzoic

acid and oil of bitter almonds; and cinnamic acid may be converted into benzoic acid by oxidation.

Cinnamic acid is one of the active principles in many of the balsams and enjoys an excellent reputation in the treatment of tuberculosis and chronic ulcerative processes. It is a marked stimulant to the skin and mucous membranes, and has been very widely used in the form of an emulsion for the treatment of joint tuberculosis. Extravagant claims were made for it years ago, but these have been shown to be premature, although at the present time the drug is very widely used.

**Cin'namon**, the bark of the under branches of a species of laurel (*Cinnamomum zeylanicum*), which is chiefly found in Ceylon, but grows also in Malabar and other parts of the East Indies. The tree attains a height of 20 or 30 feet. Its leaves are oval, the flowers are of a pale yellow color, and the fruit is shaped somewhat like an acorn. There are two principal seasons of the year in which the Ceylonese bark the cinnamon-trees. The first of these commences in April, and the last in November; the former being that in which the great crop is obtained. In this operation the branches of three years' growth are cut down, and the outside pellicle of the bark is scraped away. The twigs are then ripped up lengthwise with a knife, and the bark is gradually loosened till it can be entirely taken off. It is then cut into slices, and on being exposed to the sun curls up in drying. The smaller pieces, or "quills," as they are called, are inserted into the larger ones, and these are afterward tied into bundles. Cinnamon is examined and arranged according to its quality by persons who, for this purpose, are obliged to taste and chew it. This is a very troublesome and disagreeable office, few persons being able to hold out more than two or three days successively. After this examination, the bundles are made up to a length of about four feet, and a weight of about 88 pounds each. From the roots of the trees numerous offsets shoot up. These, when they have attained the height of about 10 feet, are cut down and barked, being then about the thickness of a common walking-stick. The cinnamon which they yield is much finer than any other. In Ceylon the cinnamon-trees are said to be so common as to be used for fuel and other domestic purposes. The smell of cinnamon, particularly of the thinnest pieces, is delightfully fragrant, and its taste pungent and aromatic, with considerable sweetness and astringency. If infused in boiling water in a covered vessel it gives out much of its grateful flavor and forms an agreeable liquid. An oil is extracted from cinnamon, which is heavier than water. This is prepared in Ceylon, and almost wholly from the small and broken pieces. It is made, however, in such small quantity that the oil of cassia is generally substituted for it: indeed, the cassia bark is often substituted for cinnamon, to which it has some resemblance, although in its qualities it is much weaker. The leaves, the fruit and the root of the cinnamon plant all yield oil of considerable value. That from the fruit is highly fragrant, of thick consistence, and at Ceylon was formerly made into candles for the sole use of the king.

The oil of cinnamon consists mainly of cinnamic aldehyde,  $C_9H_8O$ , which, when pure, is

## CINNAMON FERN — CINTRA

colorless. By exposure to air it absorbs oxygen and is converted into cinnamic acid (q.v.).

Various forms of cinnamon have been used for many years in medicine as flavoring agents and as carminatives. As cinnamon is rich in volatile oils, the action of the drug resembles the action of the oil of cinnamon, which is closely allied to other volatile oils (q.v.). The active principle in the oil is an aldehyde of cinnamic acid, and its antiseptic and antispasmodic action is due in large part to the cinnamic aldehyde.

**Cinnamon Fern**, a species (*O. cinnamomea*) of royal fern (*Osmunda*), so called from the cinnamon color of the sporanges. The plant has been known to reach the height of 11½ feet. It is frequent in boggy places during May and June in Florida and Mexico, and as far north as Minnesota and Nova Scotia. See *OSMUNDA*.

**Cinnamon Oil**, an essential oil distilled from cinnamon bark. It is of a bright yellow color, which gradually darkens. It consists chiefly of cinnamic aldehyde. When exposed to the air, it gradually absorbs oxygen and forms a resin and cinnamic acid.

**Cinnamon-stone**, or **Essonite**, a variety of grossularite garnet, usually of a beautiful cinnamon-brown, yellowish, or brownish-red color. It is a silicate of aluminum and calcium. Its name essonite is derived from the Greek *esson*, inferior, and refers to its hardness, 7, being inferior to that of hyacinth, which it often resembles. It occurs in isometric crystals, usually in rhombic dodecahedrons. Cinnamon-stone from Ceylon is the finest known, and has long been cut into gems. Beautiful specimens are also found at Piedmont, Ala., and Phippsburg, Me.

**Cinnamomum**, sîn-a-mō'mūm, a tropical genus of plants of the laurel family, natives of Asia and the Pacific islands. The genus numbers upward of 50 species, all possessing aromatic volatile oils, that make them valuable articles of commerce. Cinnamon proper is the prepared bark of *C. zeylanicum*; Culiwan bark comes from the *C. culiwan*, and cassia bark from *C. cassia*. The best-known American relative, although not of the same genus, is sassafras. See *CASSIA*; *CINNAMON*; *LAURACEÆ*.

**Cino da Pistoia**, chē'nō dā pēs-tō'yā, Italian jurisconsult and poet: b. Pistoia 1270; d. there 24 Dec. 1336. He ranks among the best of the early Italian poets, and resembles Petrarcha more than any of the other predecessors of this poet. His poems were first published at Rome in 1558 by Pilli. They afterward appeared at Venice increased by a second volume, which, however, was not considered genuine. The most complete edition is that of Ciampi (1812). He published a commentary on the first nine books of the 'Codex Justinianus' in 1314.

**Cinquefoil**, sînk'foil. 1. In botany, a species of the genus *Potentilla* of the Rose family, closely allied to the strawberry. There are upward of 150 species, chiefly natives of the temperate regions of the northern hemisphere, 60 of them occurring in North America, being found in Greenland, south to New Jersey, to northern Mexico, and in all the territory of the western and northwestern part of America to Alaska. In northern New England the shrubby

cinquefoil (*P. fruticosa*) is a troublesome weed. The name of the genus is from Latin *potens* (powerful), from the supposed powerful medicinal virtues of some of the species.

2. In architecture, an ornament in the Gothic style, consisting of five foliated divisions, often seen in circular windows. In heraldry, it means a five-petalled corolla borne without a stalk and full-faced.

**Cinq-Mars**, Henri Coiffier de Ruze, ôñ-rê kwâ-fê-yâ dè rû-zâ sâñ-mar, MARQUIS DE, French courtier: b. 1620; d. Lyons 12 Sept. 1642. At the age of 18 he was presented at court by Cardinal de Richelieu, and soon obtained the favor of Louis XIII., to whom he became master of the horse. Chafing at the restraint under which Richelieu held him, and ambitious of political power, he framed a conspiracy to overthrow the cardinal, of which the king himself, and his brother Gaston, Duke d'Orleans, were members. But Louis was weak and fickle, Gaston perfidious, and Richelieu not the man to be put down by a youth just turned of 20. Cinq-Mars was delivered up to the cardinal, and beheaded at Lyons with his friend, the councillor De Thou.

**Cinq-Mars**, a historical romance by Alfred de Vigny, published 1826. The subject is the conspiracy of Cinq-Mars and De Thou against Richelieu, its detection, and the execution of the offenders at Lyons in 1642. The work is modeled after the Waverley novels.

**Cinque Pace**, sînk-pās, a kind of grave, stately dance, in which the steps were regulated by the number 5.

**Cinque Ports**, sînk-pôrts, seven ports of England, on the coasts of Kent and Sussex—Dover, Sandwich, Hastings, Hythe, Romney, Winchelsea, and Rye. They were originally only five, the two latter having been declared ports subsequent to the first institution; hence the name *cinque*, five. The precise designation of these seven localities is "The Cinque Ports and the Two Ancient Towns," the last named being Winchelsea and Rye. They were granted special privileges by the later Saxon and earlier Norman kings, on condition of providing a certain number of ships during war, there being no permanent English navy previous to the reign of Henry VII. The ports are, collectively, in the jurisdiction of a lord warden, whose office, though the salary is £3,000 a year, is little more than a sinecure. See Burrows, 'The Cinque Ports' in Historic Towns series.

**Cinquecento**, chîng-kwê-chên'tô, in Italian, 500, an abbreviation for *mille cinquecento*, or 1,500. The term is used to designate the art styles of the 16th century, or such as were developed about, or after, 1500. In like manner the terms *trecento* and *quattrocento* denote art of the 14th and 15th centuries. The Cinquecento is the period of the highest perfection of the arts of the Revival or Renaissance.

**Cintra**, sên'trâ, Portugal, a town in the province Estremadura, 15 miles northwest of Lisbon, on the slope of the Sierra de Cintra. The country around is extremely beautiful, and the climate mild and agreeable. On these accounts it is much resorted to by the wealthier inhabitants of Lisbon, who have here their *quintas* or country houses. The kings of Portugal have a palace at Cintra, with fine gardens

## CINURA — CIPHER WRITING

ornamented with fountains. Cintra is celebrated for the convention entered into there in 1808, by which the French, after their defeat at Vimiera, were not only permitted to leave Portugal, but were conveyed to France with their arms, artillery, and property. Pop. 4,846.

**Cinura**, *sī-nū'ra*, a name proposed by Packard for a subdivision of the *Synaptera* under *Thysanura*. It includes the bristle-tails (q.v.) See Packard, 'Entomology for Beginners.'

**Ciotat**, *sē-ō-tā*, **La**, France, a seaport, department of Bouches-du-Rhône, on the Mediterranean, 15 miles southeast of Marseilles. It has a safe and commodious harbor, and carries on a considerable trade in the productions of the district. The yards and workshops of the Messageries Maritimes Company employ about 3,000 hands. The town, surrounded by its old ramparts, consists of well-built houses and spacious well-paved streets. The surrounding district yields wine, oil, oranges, etc. Pop. 11,300.

**Cipher**, a kind of monogram, in which the initials of a person or persons are intertwined with each other.

**Cipher Despatches.** On the meeting of Congress in December 1876, owing to the disputed presidential election returns, each chamber instituted an inquiry into the alleged frauds; the Senate (Republican) through its committee on privileges and elections; the House (Democratic) by a select committee on Louisiana affairs, popularly known as the Morrison Committee, from its chairman, William R. Morrison (q.v.). Each committee subpoenaed the Western Union Telegraph Company for the political despatches of that period in its possession; and portions of these, which the company had gathered from its various offices and forwarded to New York, were sent to each. A large number of these were in cipher; their political nature being inferred from the names and locations of senders and addressees. The Senate, though calling for telegrams from all portions of the country, devoted themselves mainly to Oregon where, it was alleged, from the translation of Democratic cipher telegrams, \$8,000 had been devoted to securing the legislature's recognition of a Tilden elector. (These telegrams and translations were published in Senate Miscellaneous Document No. 44, 44th Congress, 2d session.) These despatches, after the investigation closed, were ostensibly returned to the Western Union; those from the Morrison Committee apparently were all returned. But the cipher despatches before the Senate committee were sorted over and the Republican ones nearly all destroyed (by Senator O. P. Morton, as said); while certain packages of the Democratic ones were preserved (by the same hands), and came into possession of Thomas J. Brady, the second assistant postmaster-general, William E. Chandler, afterward secretary of the navy, then lawyer and political manager, and Frank Hiscock, representative from New York. By these, in the summer of 1878, they were sent to White-law Reid, editor of the *New York Tribune*, who published them serially, including the cipher despatches and professed translations. These were made by John R. G. Hassard and Col. William M. Grosvenor, of the *Tribune* staff, partly on suggestions of Prof. E. S. Holden of Washington; involved the use of several

different ciphers, and different applications of the same cipher; and left some words illegible. As printed, they referred to offers of the disreputable "returning boards," then supreme in South Carolina and Florida, to sell their vote to Tilden for large sums in cash, \$80,000 to \$200,000; and negotiations of Democratic managers with them, closed by Tilden's refusal to make the bargain, and the transfer of the votes to Hayes. Tilden himself denied all knowledge of the telegrams or their subject matter, and the managers denied the accuracy of the translations. Their moral defense in the public mind was that they were submitting to blackmail to obtain what they believed legally and equitably theirs already, and that the Republican telegrams, if published, would have left that party in no better case. On 21 Jan. 1879 the new House appointed a "select committee on the alleged frauds in the election of 1876," avowedly to investigate the cipher despatches. It received from Benjamin F. Butler of Massachusetts another package of the telegrams, partly unpublished, given him by Mr. Chandler, and took a mass of testimony—published in House Miscellaneous Documents, 45th Congress, 3d session, Vol. V., with the telegrams and the translations, except those already published in the Senate document above cited.

**Ciphers**, signs for numbers (see NOTATION). They are either borrowed signs, as letters, with which the Greeks and several tribes of the north of Europe designated their numbers; or peculiar characters, as the modern or Arabic ones. The ciphers, such as they are at present, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, did not attain their present character till a pretty late period. We have them from the Arabians, who derived them from Hindustan. It seems probable that the Egyptians were acquainted with the present system of ciphers, at least in its principles. As early as the 9th century ciphers were used, though seldom, in France. Not until the 11th century did their use become common in Europe.

**Cipher Writing**, a method of sending important intelligence in a manner so effectually disguised that only those for whom the news is intended can understand the meaning of what is written. Till comparatively recent years diplomats, statesmen, and military or naval commanders were the principal persons compelled by circumstances to keep their affairs or their intended movements shrouded in secrecy. So long as there was not regular postal service important letters were sent by courier, and thus the weightiest secrets were often at the mercy of any one inclined to be dishonest. Before the spread of education, and at a time when few possessed a knowledge of any other language than their own, to indite a letter or despatch in a foreign tongue was usually ample protection against a surreptitious prying into its contents. But it is now many years since this safeguard was broken down, and it became necessary for all who did not want their correspondence known to interested parties to contrive some means of communicating with the pen that would defy scrutiny.

Hence there came into extensive use the art of writing in cipher, called also cryptography, from the Greek words *κρυπτός*, "secret," and *γράφειν*, "to write." Under this term are in-

cluded all private alphabets or systems of characters for the safe transmission of secrets. As fast as one device was discovered human ingenuity contrived another still more intricate. A cipher sufficiently perplexing for all ordinary purposes is found by using the alphabet in any language in an inverted order, taking Z for A, Y for B, X for C, and so on. When it is only desired to write a cryptogram, and not print it, such other characters may be used as are mutually agreed upon by correspondents, or the alphabet may be transposed in other ways. A figured cipher is one in which the letters of the alphabet are numbered, and these numbers compose the cryptogram. To insure secrecy it is, of course, necessary that the particular series of numbers chosen shall be known only to those who use the cipher. Another plan consists in choosing a certain book—a dictionary appears to have been the favorite—and by a simple citation of the number of the page, of the column, and of the line, sentences were constructed, the key to which was extremely difficult of discovery by one not in the secret.

As the number of different dictionaries was necessarily limited, however, the mystery could usually be solved by any one willing to devote time and patience to hunting up the particular one adopted. Various other books have been similarly used, such as spelling-books, and even the Bible; but these systems were cumbersome, and were all more or less open to detection. From a few rules, as for instance, that in English *e* is the letter which most frequently occurs, and *the* the most common word, the whole might generally be deduced. The task of detecting cipher methods is rendered much more difficult when false characters, which are not to be counted, have been interspersed throughout the cipher. A curious explanation of the process of unraveling a cipher is given in Poe's story of the 'Gold-Bug.' Still, with devices such as these, more or less ingenious, the world was fain to be content until about 40 years ago, when a scientific discovery was made that indirectly converted cryptography into a recognized calling, requiring thought, labor, and inventive ability.

The opening years of the second half of the 19th century found the world in amazement over the then recent invention of telegraphy. Immediately a new want made itself felt. Secrecy had been sacrificed at the shrine of speed. If the mail was slow, it afforded privacy, but the contents of a telegraphic message are of necessity known to others besides the sender and the receiver. So the minister, the banker, and the merchant soon began to send cipher despatches. It was quickly discovered, however, that existing methods of cipher writing were unadapted to telegraphy; the costliness of the new invention necessitated brevity; and thus it was not long before there went whirling over the wire messages of 10 words that, properly deciphered, included from 30 to 50.

A great proportion of commercial messages—orders to buy and sell and the like—are similar in their terms, and hence it is that a single word representing three or four words in frequent use is the plan on which our present cable ciphers are based, whereby there is annually a large saving in expense. Then, too, as trade increased and competition became fierce, every firm wanted its own cipher system, dis-

tinct from any used by other houses in the same business; and reflection will enable us to appreciate the vast number of separate ciphers in use in a great commercial centre like New York. Therefore, in course of time, the preparation of cipher systems for merchants and others using the telegraph largely came to be a regular calling, and in every large city the sign "Cable Codes" is to be seen.

At one of these offices a person may be accommodated with a code of from 50 to 5,000 words. Most of these codes are alphabetically arranged in parallel columns, like shipping signals—the English words and phrases in one column, and their cipher equivalents in another. To such magnitude has this business grown that all languages are ransacked for suitable cryptographic codes, and every day sees their preparation growing more complicated and costly. The modern telegraphic signals and our various systems of short-hand may be called examples of cipher writing, though in these cases, of course, speed and brevity are aimed at, not secrecy.

The cipher codes of the State Department at Washington are frequently changed. The special code is entrusted to the personal custody of diplomatic officials embarking on a mission, who retain possession of it and destroy it if their lives are endangered. The imprisonment of the United States Minister Conger, in Peking, in 1900, caused the cipher to figure conspicuously in international relations. China objected to the transmission of cipher despatches, but subsequently withdrew her objection. She was accused of having obtained surreptitious possession of a copy of the United States cipher code.

**Cippus**, sip'ūs, a low column generally rectangular and sculptured, and often bearing an inscription, used by the Romans for various purposes. Cippi served as sepulchral monuments, as milestones and boundaries, and in some cases to receive the inscribed decrees of the senate. They were frequently or usually adorned with rams' heads supporting festoons of flowers, figures of sphinxes, and various mythological subjects. Those serving as tombstones regularly bore such inscriptions as D.M. for *Dis Manibus*, and S.T.T.L. for *Sit tibi terra levis*.

**Cipriani**, Giambattista, jām-bāt-tēs'tā chē-pre-ā'nē, Italian painter and engraver: b. Pistoia 1732; d. London 1785. He was one of the first Fellows of the Royal Academy. His drawing is correct, his heads have grace and loveliness, his coloring is harmonious, and the general impression of his composition good. Many fine engravings of Bartolozzi are from the designs of Cipriani.

**Circars**, sēr-kār'z, **The Five Northern**, an ancient division of the Madras presidency, on the east coast of Hindustan. The northern Circars were formerly Chicacole, Rajahmundry, Ellore, Condapilly, and Guntur; but the districts that now correspond most nearly with them are those of Ganjam, Vizagapatam, Godavari, and part of Krishna. They were among the earliest of the territorial possessions of the East India Company, which acquired four of them in 1765, from Mogul Shah Allum, who bestowed them on the company as a free gift.

## CIRCASSIA

The fifth, Guntur, came into the possession of Great Britain in 1788.

**Circassia**, *sir-kāsh'i-a*, a region in the southeast of European Russia, lying chiefly on the north slope of the Caucasus, partly also on the south, and bounded on the west by the Black Sea. It forms part of the government of the Caucasus, including a great portion of the territory of the Kuban and the districts of Sukhum and Tchernomore, but is not itself an official division; and, indeed, the name is now much less seldom heard than formerly, since the country has been entirely incorporated with the rest of the Russian possessions in this quarter, and has no longer a separate political existence. The whole region is mountainous, and is composed of the northern masses or western offshoots of the great chain of the Caucasus, the culminating heights of which are those of Mount Elbruz. The mountains are intersected everywhere with precipitous ravines, in the deepest hollows of which flow rock-impeeded streams that occasionally become raging torrents. The chief rivers are tributaries of the Kuban and the Terek, the first of which bounds the territory on the northeast and east sides, while the Terek skirts the Circassian limits on the southeast side. Circassia is a beautiful, though rugged, country. The sides of the mountains are often clothed with thick forests. Its climate is temperate, its inhabitants healthy and long-lived. There are few manufactures and little trade.

When Russia took possession of this region the exodus of the inhabitants left but comparatively few Circassians proper, and those who remained have now to a large extent lost their national peculiarities. The people call themselves Adighé; the Tartar word *Tchertkess* being a slanderous name applied to them as "robbers." The Circassians were divided into several tribes, having three distinct languages, or more. Each tribe included five ranks of men, namely, princes or chiefs (*pshat*); nobles (*work*); middle class (*thlofokl* or *tokavs*); serfs, or retainers of the nobles; and slaves—the latter being prisoners taken in war, or the descendants of such. All classes except the slaves were united into fraternities, for mutual support; and this union formed the real groundwork of the government of the country, which was altogether peculiar, being patriarchal in nature, with a great amount of freedom. Hereditary feud, once prevalent, was latterly almost extirpated, and pecuniary compensation, including a mulct upon manslaughter for the benefit of the deceased's fraternity, was substituted. Crimes of all degrees, and civil causes, were judged either in general or local councils; and petty offenses by district judges and assessors.

The religion of the country was chiefly Moslem; but in many cases it formed a jumble of Christian, Jewish, and heathen traditions and ceremonies. In no case was it very strict; although most of the chief Mohammedan feasts and fasts were pretty well observed. The morals of the people were nevertheless respectable. Great crimes were rare; and such as have their source in poverty with one class, and avarice in the other, were not common, for property was little coveted, and money was scarcely known. The commerce of presents was universal; few or none were very rich, and

there were no miserably poor at all. There was no tenure of land in Circassia except what immediate possession, for the purposes of cultivation, gives.

Agriculture here is still in a rude state, but the produce of the tilled lands is considerable, and exceeds local wants. The forests yield great quantities of fine wood, including, oak, and all our own best species of timber trees, with (in the southern regions) boxwood, etc. The chief grain is millet; but barley, oats, and a little wheat are also raised. There are great numbers of goats, sheep, and oxen.

The Circassians, male and female, are a well-formed and handsome race. The males are highly prized as warriors by the Russians, and the females as mistresses by the Turks, a position generally envied by the women themselves. The men are among the finest equestrians in the world; and their horses, though small, are of good make, hardy, and intelligent.

The early history of the Circassians is obscure. They have no annals; but their minstrels, in their martial and genealogical strains, preserve traditional accounts of the deeds and lineage of their dead heroes and existing tribes. Between the 10th and 13th centuries this country formed a portion of the empire of Georgia, and it is said the Georgian queen Tamar subjected and for a time Christianized them. During the Middle Ages the Genoese had several trading stations on the coast, of which some memorials yet exist. In 1424 the Circassians were an independent people, and at war with the Tartars of the Crimea, etc., to whose khans, however, it is understood some were occasionally tributary. In 1555 the Muscovite czar, Ivan Vasilievitch, came to his aid against the Tartars, and married a Circassian princess. But the stay of the Russian forces was short, and after their withdrawal the belligerents kept up a struggle with varying results till 1705, when the Tartars were finally defeated in a decisive battle. Shortly after the territorial encroachments of Russia on the Caucasian regions began. From that time she advanced by steps slow and stealthy, and in 1781 obtained a frontier line on the right bank of the Kuban, the left banks of which formed the national limit of Circassia. In 1784 the Turks founded Anapa, near the northeast corner of the Black Sea, as a place of trade for their commerce and that of the Circassians; this was the only territorial settlement they as yet had in or near the country, and the place was a mere factory. In 1807 the Russians took Anapa from the Turks; but in terms of the Treaty of Bucharest, in 1812, it was restored. In 1829 it was once more taken by the Russians, and finally ceded to them by the Treaty of Adrianople, along with the whole of Circassia—as they interpreted the words of that cunningly ambiguous document; the fact being that not an inch of the territory of Circassia proper had ever been in the possession of either Turks or Russians. Many of the Circassians were, indeed, Mussulmans, and all such recognized the padisha (sultan) as their spiritual head, but nothing more. As the "hated Muscovites" (*fana Moscov*) immediately proceeded to act upon the pretended cession, a struggle commenced which was continued over a long series of years. The spirit of resistance to Russia became stronger than ever; and a bold leader, Schamyl, who united

## CIRCE — CIRCLE OF CURVATURE

in his person the imputed sanctity of the hierarch with the daring courage and prudent conduct of a great warrior, with his heroic band beat off or baffled the whole disciplined forces that Russia was able to send against him. But at length the protracted resistance of the people terminated in the triumph of the more powerful of the two foes, and the Circassians with their leader surrendered. Large numbers of them, as many it is said as 500,000, were deported into the Turkish provinces in 1864, and were settled both in Asia Minor and in Bulgaria and Servia. A considerable portion of their former country was thus almost denuded of inhabitants.

**Circe**, sēr'sē, in classical mythology, a sorceress on the island of Aea. Ulysses in his wanderings landed on her island, and sent out Eurylochus with a party to explore the country. They arrived at the palace of Circe, who gave them food and wine, and with her magic wand changed them into swine. Eurylochus only, by cautiously abstaining from the magical potion, escaped the transformation, and informed Ulysses of the event. He immediately proceeded himself into the country to free his companions. On the way Hermes (Mercury) met and advised him. Following the advice of Hermes he then ran upon her with his drawn sword, threatening her with death, and compelled her to bind herself by an oath to do him no injury, and deliver his companions. Ulysses then remained with her a whole year. Before his departure she told him that in order to secure a safe return to his country he must visit the infernal regions and ask advice of Tiresias. This he did, and again visited Circe on his way back.

**Circinus**, sēr'sī-nūs ("the Pair of Compasses"), one of the 14 southern constellations added to the heavens by Lacaille in connection with his work at the Cape of Good Hope in 1751-2. It is surrounded by Apus, Musca, Centaurus, Lupus, Norma, and Triangulum Australe.

**Circle**, in geometry, a plane figure contained by one line, which is called the "circumference" and is such that all straight lines drawn from a certain point (the "centre") within the figure to the circumference are equal to one another. According to this definition of Euclid, which is remarkable for its perspicuity and precision, the circle is the space enclosed, while the circumference is the line that bounds it. The circumference is, however, frequently called the circle. Still no confusion ever arises from this usage.

The properties of the circle are investigated in books on geometry and trigonometry. Properly the curve belongs to the class of conic sections, and is a curve of the second order.

The celebrated problem of "squaring the circle" has given rise to extraordinary geometrical labors, and even now there are to be found, as in the case of the problem of perpetual motion, those who profess to have solved it. The question is to find a square whose area shall be equal to the area of a circle. It is not possible to do so. All that can be done is to express approximately the ratio of the length of the circumference of the circle to the diameter, and to deduce the area of the figure from this approximation. This ratio has, however, been determined to a degree of exactness

more than sufficient for all practical purposes. If the diameter be called unity, the length of the circumference of the circle is 3.1415926535...; and the area of the circle is found by multiplying this number by the square of the radius. Thus the area of a circle of 2 feet radius is  $3.14159 \times 4$ , or 12.56636 square feet, approximately.

For trigonometrical calculations the whole circumference of the circle is divided into 360 equal parts or arcs, called degrees; each degree is divided into 60 minutes, and each minute into 60 seconds. The angles subtended at the centre by these arcs are called respectively degrees, minutes, and seconds of angle.

In practical astronomy a circle is an instrument for measuring angles by means of a metallic circle accurately divided. The general principle is to have a telescope movable accurately in one vertical plane, and an arm attached to it which moves over the graduated circle placed in a parallel plane. The arm carries microscopes and verniers for reading off minutely the angle it has traversed.

There are two great classes of these instruments, transit circles and mural circles (qqv); and there are other less important instruments of this kind.

In logic, a circle is the fault of an argument that assumes the principle it should prove, and afterward proves the principle by the thing which it seemed to have proved. The same fault takes place in definitions when an idea is defined by others which suppose the knowledge of the first. Arguing in a circle is a fault into which men are very liable to fall, particularly in theological discussions.

In astronomy, the heavens being considered as a spherical surface drawn round the earth as centre, an imaginary line drawn round the heavens so as to lie in one plane is a circle of the sphere. It is a "great circle" if the plane of it passes through the centre; thus the celestial equator and the ecliptic are great circles; if the plane of the circle does not pass through the centre it is called a "small circle"; all circles of declination except the equator are small circles.

**Circle of Curvature.** When a point in motion is tracing out any curved path, the direction of motion changes from point to point of the curve, and the path is said to be more or less curved according as the direction of the motion of the point changes more or less rapidly. The curvature at any point is measured by the rate of this change at the point per unit length of the curve.

In the case of the circle the curvature is the same at every point; and it is easy to show that the curvature measured as above is equal to the reciprocal of the radius of the circle.

If we consider any small portion of any curve whatever, it may be approximately taken as an arc of a circle, the approximation being closer and closer to the truth as the portion considered is smaller and smaller, and by taking it small enough we may make the approximation as close as we please. The curvature is then the reciprocal of the radius of this circle.

The circle which coincides more nearly than any other with an infinitely small arc at any point of any given curve is generally found by means of the methods of the differential calculus. Such a circle is called the circle of curva-

## CIRCLE — CIRCULAR POLARIZATION OF LIGHT

ture, and sometimes the osculating circle. The radius of it is called the radius of curvature of the curve at the point considered; and the centre of this circle is called the centre of curvature.

**Circle, Magic,** a space in which sorcerers were wont to protect themselves from the fury of the evil spirits they had raised. This circle was usually formed on a piece of ground about nine feet square (in the East seven feet appears to have been considered sufficient), in the midst of some dark forest, churchyard, vault, or other lonely and dismal spot. It was described at midnight in certain conditions of the moon and weather. Inside the outer circle was another somewhat less, in the centre of which the sorcerer had his seat. The spaces between the circles, as well as between the parallel lines which enclosed the larger one, were filled with all the holy names of God, and a variety of other characters supposed to be potent against the powers of evil. Without the protection of this circle, the magician, it was believed, would have been carried off by spirits. Another figure which, described upon the ground, could bar the passage of a demon, was the pentagram.

**Cir'cleville,** Ohio, a city and county-seat of Pickaway County, on the Scioto River, the Ohio Canal, and the Cincinnati & M. V. and the Norfolk & W. R.R.'s, 28 miles south of Columbus. It derives its name from a circular earth-work built by some ancient people, and which is the site of the present city. It has numerous churches, several daily and weekly newspapers, three banks, and manufactures flour and meal; agricultural implements, furniture, canned goods, etc., and a large pork-packing industry. Pop. (1900) 6,991.

**Circuit Court.** See **COURTS.**

**Circular Motion.** A body in motion, which is continually impelled by some power toward a fixed point out of its original direction, is obliged to describe a curvilinear path round this point. A stone slung round by a string moves in a circle, because it is drawn toward the hand in every point of its path. The moon moves in a circle round the earth, because it gravitates toward the earth, and is thus drawn from the rectilinear direction which it would otherwise pursue. In such cases the point to which the body constantly tends is called the centre of the forces; the force itself, by which it is impelled, is called the centripetal force; that by which it strives to fly from the centre is called the centrifugal force; and the motion which is produced by these two forces, the circular motion. All the planets in the solar system are carried round the sun, and the satellites round their planets, by these forces. (See **CENTRAL FORCES.**) The theory of circular motion is a subject of celestial mechanics, on which Newton composed his 'Philosophiæ Naturalis Principia Mathematica'; and Laplace, his 'Mécanique Celeste,' etc.

**Cir'cular Notes,** in commerce, notes or letters of credit furnished by bankers to persons about to travel abroad. Along with the notes the traveler receives a "letter of indication" bearing the names of certain foreign bankers who will cash such notes on presentation, in which letter the traveler must write his name. On presentation the foreign banker can de-

mand to see the letter of indication, and by causing the presenter to write his name, can compare the signature thus made with that in the letter, and so far satisfy himself as to the identity of the person presenting the note.

**Circular Numbers,** numbers whose powers end on the same figure as they do themselves: such are numbers ending in 0, 1, 5, 6.

**Circular Parts, Napier's Rule for,** a rule invented by Baron Napier of Merchiston, near Edinburgh, for the solution of all cases of right-angled spherical triangles, eminent for its comprehensiveness and utility in extensive surveys, navigation and practical astronomy. See **TRIGONOMETRY.**

**Circular Polarization of Light.** Plane-polarized light is altered into circularly polarized light by passing in a particular direction through a Fresnel's rhomb. This is a paralleloiped of glass with its faces set at certain angles depending on the refractive power of the glass. The light entering one base of the rhomb is twice internally reflected before it emerges at the opposite base; and while common unpolarized light passes through the rhomb without suffering alteration plane-polarized light has its properties in general completely altered. The final result depends on the inclination of the plane of polarization of the incident light to the plane of the internal reflections. In two cases, namely, when this angle is  $0^\circ$  or  $90^\circ$ , the emerging light is still plane polarized; when the angle is  $45^\circ$  the light is circularly polarized; in every other case it is elliptically polarized. In the first case, as will be understood from consulting the article on **POLARIZATION OF LIGHT**, the analyzer, on being applied to test the beam, shows in one position bright light, and on being turned round the principal axis through  $90^\circ$ , total darkness. In the last case—that of elliptic polarization—the analyzer shows, on being turned round, a beam of varying intensity, but never complete extinction. In the case of circularly polarized light the analyzer, on being turned round, shows a beam of the same intensity in every position of the analyzer, and, in fact, does not at first sight differ from ordinary unpolarized light. When, however, it is examined—not with a Nicol's prism direct, but after a second Fresnel's rhomb has been interposed—it is found to differ very remarkably from unpolarized light. The latter is, as we have remarked, unaffected by the rhomb; the circularly polarized light emerges from the second rhomb plane polarized. It is thus shown how to produce and how to recognize circularly polarized light. We now give a few of its most remarkable properties.

The light as we have said, that emerges from the second Fresnel's rhomb is again plane polarized, but it does not emerge precisely as it entered. For, except in one particular position of the two Fresnel's rhombs, the light that emerges from the second rhomb has its plane of polarization changed; the plane is turned round, in fact, through an angle depending on the positions of the two rhombs with regard to the original plane of polarization; and it may be turned round either in a right-handed direction, as it is called (see below), or in a left-handed direction. We might arrange a set of pairs of Fresnel's rhombs, it is evident, in such positions that each pair should give the plane of polariza-

## CIRCULAR SAILING — CIRCULATION

tion of the ray passing through it a farther twist in the same direction, and we might turn it thus through any angle whatever. Such a power as we have imagined in a set of Fresnel's rhombs is possessed by quartz and by a considerable number of solutions of organic bodies, and it is known as a power of rotating the plane of polarization. When a beam of homogeneous light has passed through the polarizer, and the analyzer is placed in the position of total extinction of the ray (see POLARIZATION OF LIGHT), on introducing a plate of quartz the light reappears; but on turning the analyzer round, either in a right-handed direction or in a left-handed direction (whence the names), extinction is again obtained. Quartz is named right-handed quartz or left-handed quartz according to the direction in which the analyzer must be turned. The amount of the angle through which it must be turned depends on the thickness of the plate of quartz.

If, instead of using homogeneous light, as we have been supposing, plane-polarized white light is employed, it is found that the different rays are differently deviated. The effect on the more refrangible rays is greater than on the less refrangible, and the plane of polarization of the blue rays will thus be turned through a greater angle than that of the red rays. It will be perceived from this, that having arranged the polarizer and analyzer, and inserted a plate of quartz, as described above, on rotating the analyzer in the direction, right-handed or left-handed, that corresponds to the nature of the plate of quartz, we shall not arrive at a position of total extinction, but we shall see a most beautiful play of colors changing in order from red to yellow, then to orange, green, and blue. These phenomena are among the most beautiful and most striking of all the marvelous phenomena of light.

It has been remarked above that certain organic liquids and solutions have this rotatory power. Among these may be mentioned turpentine, some essential oils, solutions of sugar, and solutions of tartaric acid. This fact is taken advantage of in Soleil's saccharometer (q.v.), an instrument for determining the value of cane-sugar in a liquid.

We have spoken above of the right-handed and left-handed properties of quartz; a discovery of Haüy leads us here to the very threshold of the molecular structure of crystals. We may yet hope for discoveries in this direction. On comparing crystals of quartz that give us right-handed and left-handed polarization, it is found that a very remarkable property connects their forms. The crystals that give right-handed and left-handed polarization are of an unsymmetrical construction, such that either viewed in a looking-glass gives an image of the same form as the other. Pasteur, examining the crystals of the two varieties of tartaric acid whose solutions have opposite rotational powers, but whose chemical properties are very nearly the same, showed that the same law holds for them; and, having crystallized what is known as neutral tartaric acid, was able, by picking out the crystals by hand, to separate it into equal portions of *laevo* tartaric acid and *dextro* tartaric acid. But we must refer the reader to the special articles on the chemistry of this substance.

One of Faraday's most brilliant discoveries was the rotatory power of glass under the action of a powerful magnet. The reader is referred for an account of it to the article POLARIZED LIGHT.

**Circular Sailing.** See GREAT CIRCLE SAILING.

**Cir'culating Library.** See LIBRARIES.

**Circulation**, in animals, the passage of blood in circuit through the body; in vegetables, a similar circuit of sap.

*Circulation of the Blood.*—This process is widely distributed throughout the animal kingdom, even the irregular movement of blood in the lowest animals being termed a circulation. Properly speaking, however, only fishes, birds, and mammals may be said to have a distinct circulation. In the lower animals, such as the lobster or crab, there is no continuous vascular system, the arteries ending in lymph spaces. In birds and mammals, however, a particle of blood starting at any given point in the system makes a complete circuit and repasses its point of starting.

*History.*—In the chapter on anatomy the point was reached where the important discoveries of Harvey had revealed the secret of the circulation and that the study of human physiology was set on a secure basis, but in the matter of the circulation all the credit of discovery is not due to Harvey alone. It will be recalled that the authority of Galen persisted for over 1,000 years, and that the opening of the 16th century found a number of enthusiastic anatomists who founded a school of their own, and the new Vesalian anatomy replaced the old Galenic anatomy, but unfortunately not Galen's physiology. The old doctrine of Galen as applied to the circulation may be summed up as follows (Foster, 'History of Physiology'):

"The parts of the food absorbed from the alimentary canal are carried by the portal vein to the liver, and by the influence of that great organ are converted into blood. The blood thus enriched by the food is by the same great organ endued with the nutritive properties summed up in the phrase 'natural spirits.' But blood thus endowed with natural spirits is still crude blood, unfitted for the higher purposes of the blood in the body. Carried from the liver by the vena cava to the right side of the heart, some of it passes from the right ventricle through innumerable invisible pores in the septum to the left ventricle. As the heart expands it draws from the lungs, through the vein-like artery (or, as we now call it, the pulmonary vein), air into the left ventricle. And in that left cavity the blood which has come through the septum is mixed with the air thus drawn in, and by the help of that heat which is innate in the heart, which was placed there as the source of the heat of the body by God in the beginning of life, and which remains there until death, is imbued with further qualities, is laden with vital spirits and so fitted for its higher duties. The air thus drawn into the left heart by the pulmonary vein, at the same time tempers the innate heat of the heart and prevents it from becoming excessive. Thus from the right side of the heart there is sent to the body generally along the great veins, and to the lungs along the artery-like vein (the pulmonary artery), a flow, followed by an ebb, of crude blood endued with natural spirits only, blood serving the lower stages of nutrition. Blood flows through the artery-like vein to the lungs for the nourishment of the lungs, just as it flows through the other veins for the nourishment of the rest of the body; in both cases there is an ebb as well as a flow along the same channel. From the left side, on the other hand, there takes place along the arteries to all parts of the body a flow, followed also by an ebb, of blood endued with vital spirits, and so capable of giving power to the several tissues to exercise their vital functions. As this blood passes from the left heart along the vein-like artery to the lungs, it carries with it the various fuliginous vapors which, in the fermenting activity giving rise to the vital spirits, have been extracted from the crude blood,

## CIRCULATION

and discharges these vapors into the pulmonary passages. Arterial blood, that is, blood laden with vital spirits, reaching the brain, then generates the animal spirits, which, pure and unmixed with blood, existing apart from blood, are carried along the nerves to bring about movements and to carry on the higher functions of the body."

This is the outline of the crude Galenic doctrine, and Vesalius, brilliant anatomist that he was, was content to accept it, although there are evidences that he was very skeptical regarding much of Galen's physiological teaching. It was particularly from the anatomical side that he was most skeptical; namely, the lack of tangible holes between the two sides of the heart, which were so important to the Galenists. His skepticism was taken up by his pupils, and was also felt by others, one of them, Michael Servetus, who published a remarkable book, the '*Restitutio Christianismi*,' in which a much truer conception of the circulation of the blood was taught. This was as early as 1553. He rejected entirely the ancient doctrines, and had grasped the true doctrine of the pulmonary circulation, the passage of the blood from the right side through the lungs to the left side. Servetus, however, was a theologian more than a physician, and his early death probably prevented his further studies. Realdo Columbus, of Cremona, must be regarded as another link in the chain that led up to the final solution. He is thought to have been a tricky man, however, and one who would not hesitate to poach on another's preserves, and there are indications of his copying much from Vesalius' works and claiming them as his own. He was vain and ignorant, but in his book, '*De Re Anatomica*' (1559), he described correctly the pulmonary circulation, but he was unable to draw from it the lessons that it implied. This, by many historians, is taken as evidence that he was only a copier, and that probably the work of Servetus had been seen by him and he had claimed the discovery as his own. Cæsalpinus, a noted botanist, was the first to appreciate the fact that at the contraction of the ventricles (systole) the blood was thrown into the aorta and into the pulmonary artery, and at its diastole it received the blood from the vena cava and the pulmonary vein. He also seemed to have grasped the fact of the flow of the blood from the arteries to the veins, and of the flow along the veins to the heart. This was in 1571 and 1593. Thus Cæsalpinus had a true suggestion of the idea both of the pulmonary and systemic circulations. But Cæsalpinus' work seems to have been lost sight of, and another, Hieronymus Fabricius, had the honor to open the next door that led to Harvey's triumph. Fabricius called renewed attention to the valves in the veins, but missed their real function, and, although he was Harvey's teacher, he was more of a Galenist than a modern.

It is to William Harvey's credit, not so much that he was the discoverer of the physiology of circulation,—this, it can be seen from this brief recital, was of gradual accretion,—but that he was the first demonstrator of the process. He was the first physiological experimenter, and his work on the living animal has opened up to the world most of its priceless gifts in the field of medicine. It was by the faithful and prolonged study of many hearts of many animals that showed him that —

"the motion of the heart consists in a certain universal tension, both of contraction in the line of its

fibres, and constriction in every sense, that when the heart contracts it is emptied, that the motion which is in general regarded as the diastole of the heart is in truth its systole";

—that the true work of the heart is not that it sucked blood in, but that it drove blood out. Cæsalpinus guessed at this, or may be knew it, but Harvey proved it, and, what is more, read the consequences. He saw clearly, then, the real function of the auricles and the ventricles and of their valves, and he applied the lessons of the lesser, or pulmonary circulation, to the greater, or systemic circulation, and thus rounded out the true natural history of the process. In his own words:

"I frequently and seriously bethought me, and long revolved in my mind, what might be the quantity of blood which was transmitted, in how short a time its passage might be effected, and the like; and, not finding it possible that this could be supplied by the juices of the ingested aliment without the veins on the one hand becoming drained, and the arteries on the other hand becoming ruptured through the excessive charge of blood, unless the blood should somehow find its way from the arteries into the veins, and so return to the right side of the heart, I began to think might there not be a motion, as it were in a circle. Now this I afterward found to be true; and I finally saw that the blood, forced by the action of the left ventricle into the arteries, was distributed to the body at large, and its several parts, in the same manner as it is sent to the lungs, impelled by the right ventricle into the pulmonary artery, and that it then passed through the veins and along the vena cava, and so round to the left ventricle in the manner already indicated, which motion we may be allowed to call circular."

Thus clearly and forcefully he set forth in 1616 — although his work did not appear until 1628 — the true doctrine, and it is of interest to record that he lived to see it adopted practically by all scientists. Malpighi, in 1661, demonstrated, by means of the microscope, the capillaries, thus filling out the last link in the chain of evidence.

*Mechanics of Circulation.*—Harvey's work established the mechanical character of the heart's action, and, as it is now regarded, the heart is the pump which beats about 72 times a minute, thus forcing the blood with considerable velocity and force through the arteries. It is a double pump, as it were, both sides working simultaneously, the pulse-beat being the wave of the systolic contraction of the left ventricle. Each half of the heart consists of a smaller, less muscular portion, the auricles, and a larger, stronger portion, the ventricles, the left ventricle being much more powerful than the right. Leading into the heart and away from it are the aorta, pulmonary vessels, artery, and vein, and the vena cava. Between the auricles and ventricles are valves,—the mitral between the left auricle and left ventricle; the tricuspid corresponding on the right side; and the pulmonary and aortic valves. Starting with the spent blood that is collected from the entire body in the veins, this is carried, by pressure of the walls of the veins, through the vena cava, and emptied into the right auricle; this contracts, the valve at the orifice of the vena cava closes, the tricuspid valve opens, and the blood is forced into the right ventricle. It remains here a small fraction of a second, and this ventricle contracts, the tricuspid valve closes, and the blood is forced through the pulmonary artery into the lungs. Here it is spread out, mesh-like, in millions of capillaries, is oxygenated, and brought back to the left auricle by the pulmonary vein. The contraction of the left auricle forces the blood into the left ven-

## CIRCULATION IN PLANTS — CIRCUMCISION

tricle through the mitral orifice, the valves behind closing, and finally the great throb of the heart is caused by the ventricular systole, the mitral valve closes tight, preventing regurgitation, and the blood bounds out into the arteries, the aortic semilunar valves closing as soon as the ventricle commences to expand to get its next supply. Thus this cycle goes on 72 times a minute on the average, night and day, until death quiets the heart's action. In actual operation the right and left sides are working simultaneously, and when one listens to the heart-beat one hears only the "lub-dup," "lub-dup," of the closing auriculo-ventricular valves, and the closing aortic and pulmonary tricuspid. From the arteries the blood goes to every structure in the body in the capillaries, and returns in the veins, whose valves prevent venous congestion, and once more into the vena cava. The whole cycle is complete in about 22 seconds, one thirteenth of the entire weight of the body in blood has been thus sent round the circuit, with an initial force of the ventricular contractions of about 4.5 foot pounds at an initial velocity of about 20 inches a second. In 24 hours thus the heart's energy would lift 124 tons in weight one foot. The vital or nervous mechanism that keeps the heart in motion consists in the main of three factors, the irritability of the heart muscle itself, the action of the cardiac nervous ganglia of the sympathetic, and the cardiac regulator nerve, the pneumogastric. If a salt solution of 0.6 per cent composition is passed through the fresh heart of many of the lower animals, the heart will commence to beat, thus showing that if the heart muscle is supplied with proper liquid it must beat, hence the irritability of the heart muscle is the first and most important factor in the phenomenon of circulation. The blood salts, notably calcium and potassium, supply the irritant, and muscular contraction results, but if the heart muscle alone is beating it does so rhythmically, but the different parts do not work in efficient unison, hence the need of a regulating mechanism other than the auricle "pacemaker." This is supplied by the cardiac ganglia, their irritation causes the heart to beat more rapidly, but not in unison. The chief regulator and steadier of the heart-beat, as well as the great trophic nerve, is the tenth nerve, the pneumogastric or vagus, coming from the medulla. This nerve brings complete order and system into the heart mechanism as adjusted to other conditions in the body. Its stimulation slows the action of the heart; its paralysis causes the heart to run away, given over to the ganglia and the muscle. Another important feature in the circulation is the elasticity of the blood vessels, or vessel tone. This is maintained by the sympathetic nervous system, which raises or lowers vessel tone in accordance with the needs of the cells of the body. A regular condition of blood-vessel tonus is essential to the life of the cells of the body, muscular as well as nervous.

### *Circulation in the Lower Animal Forms.*—

The motion of a limpid fluid can be rendered perceptible only by the presence of the corpuscles which it carries. In the blood it is rendered apparent in the capillary vessels by means of its globules. In infusorial animalcules the movement of the fluids of the body is maintained by that of the animal itself and by the disturbing influence of nutritive absorption. In the *Polypi* the movement receives aid besides from the ac-

tion of cilia on the inner walls of the body. The *annelids*, as the earth-worm, possess contractile vessels traversing the length of the body. The insects, crustaceans, myriapods, and spiders have a dorsal tube which in the common crab and the spider is much shortened and broadened, but in the others remains tubular, the blood regaining its cavity through slits in the sides as well as by the openings of the trunks which the heart gives off. In these animals the circulation is incomplete, that is, the blood does not flow through canals with definite walls, but in the interstices of the tissues. The *Mollusca* have the heart provided with an auricle and a ventricle, as in the snail and whelk; two auricles, one on either side of the ventricle, as in the fresh-water mussel, or two auricles and two ventricles as in the ark shells. Among the ascidians, which stand low in that division of animals to which the mollusks belong, the remarkable phenomenon is encountered of an alternating current, which is rhythmically propelled for equal periods in opposite directions. All vertebrate animals (except *Amphioxus*) have a heart which in most fishes consists of an auricle and ventricle, but in the mud-fishes (*Lepidosiren*) there are two auricles and one ventricle; and this trilocular heart is found in the amphibians, and in most reptiles except the crocodiles, which, like birds and mammals, have a four-chambered organ consisting of two auricles and two ventricles. In these two last-named classes the venous and arterial blood are kept apart; in the trilocular hearts the two currents are mixed in the ventricle.

SMITH ELY JELLIFFE,

Editor 'Journal Nervous and Mental Disease.'

Circulation in Plants. See SAP.

**Circumcellions**, sēr-kūm-sēl'ŏnz, **Circumcellion'es**, or **Circelliones**, members of bands probably of fanatic monks, partisans of Donatus (q.v.) and the Donatists in Numidia and Mauritania who, avenging the condemnation of Donatus by the Synod of Arles (314) and the Council of Nicæa (325) and the condemnation of Donatus and his followers by Constantine and Constantius, roamed throughout those provinces pillaging and wrecking the churches and other religious establishments of the Roman Catholics and proclaiming the downfall of the empire itself. Their name probably is formed from *circum*, round about, and *cella*, cell, a monk's cell: if the derivation is correct these Circumcellions are of the same class of vagabond monks complained of by the father of western monachism, St. Benedict as *gyrovagi*, circulating vagabonds.

**Circumcision**, an amputation of a portion of the human organs of generation; principally performed on males, but sometimes on females. It has been practised in all ages, and by both civilized and savage races, as Arabs, certain African tribes, Christian Abyssinians, Australian "blacks," Malays, some North American Indians, Aztecs, Mayas, Caribs, South American Indians, Jews, Mohammedans, Fijians, and Samoans.

# CIRCULATORY SYSTEM.

4. Circulation of Blood in the Lungs.
5. Circulation of Blood in Digestive Tract.

## CIRCUMFERENCE — CIRCUMSTANTIAL EVIDENCE

In the male, the operation consists in removing a section of the prepuce. Doubtless the original object was cleanliness, a safeguard against venereal infection, or the moderation of the sexual passion, which are said to be results of the operation, but among the Jews it has always been a religious rite, for they regard it as the sign of the covenant made by Jahwé with Abraham and his posterity. The institution of the rite is recorded in Gen. xvii. Here it is stated that Abraham, then 99 years old, was himself circumcised, with his son Ishmael, 13 years old, "and all that were born in his house, and all that were bought with his money, every male among the men of Abraham's house." But by the terms of the covenant every man-child among the Hebrews was to be circumcised on the eighth day after birth, and this rule, peculiar to the race, is adhered to with such rigor that even the Sabbath observances are not allowed to interfere with the ceremony. Other Eastern nations have practised circumcision on various days,—the Arabs 7, 14, 21, or 28 days after birth, though Josephus states that in his day the Arabs circumcised after the age of 13 on account of the circumcision of Ishmael, their progenitor, taking place at that age; the Mohammedans of Persia circumcise in the third or fourth year; Fijians and Samoans in the seventh year; the Christian Abyssinians in the sixth, seventh, or eighth year; while some of the African tribes that practise the rite follow the Jewish rule, others, again, performing the ceremony between 30 and 60 days after birth.

Circumcision is universally practised by Mohammedans, not on the authority of the Koran, which does not enjoin it, but as following the example of Mohammed. It seems to be doubtful whether Mohammed's omission to prescribe the rite was due to his deeming such a rule valueless where custom already decreed it, or because he attached only a physiological and not a religious importance to the ceremony. It is, however, now recognized as a religious obligation just as strongly as if it had been ordained by the founder of Islam. Circumcision among Mohammedans may be practised seven days after birth, but it is customary to postpone the ceremony to some time between the 7th and 12th year.

Christianity recognizes no religious significance in the rite, substituting for it, according to St. Paul (Rom. ii. 25-29) "circumcision of the heart." The Church, however, celebrates as a festival the first of January, as being the day of the circumcision of its founder.

Circumcision of proselytes to the Jewish or Mohammedan faith is insisted on by the orthodox, and previous circumcision for surgical reasons is not accepted as sufficient compliance with the requirements of religion. Among some "reformed" Jews, however, the circumcision of adults has lately been abandoned. Among many savage tribes the rite is undergone at the age of puberty, and is perhaps in such instances more of a sociological than a religious ceremony, being akin to other mystic rites which mark the entrance of the young into full tribal fellowship.

The circumcision of women is effected by the removal of a portion or the whole of the clitoris. It is perhaps practised more in

Arabia than elsewhere, but has never prevailed among Jews.

Circumcision is much favored by physicians and surgeons of the present day as a hygienic measure irrespective of any religious associations.

ELFORD E. TREFFRY.

**Circum'ference**, or **Periphery**, the curve which encloses a circle, ellipse, or other plane figure. In figures bounded by straight lines, as the triangle, square, and polygon, the term perimeter is employed to designate the sum of all the bounding lines taken together. The length of the circumference depends partly on the nature of the curve; thus, that of the circle  $= 2\pi r = \pi d$  and that of the ellipse

$$= 2\pi a \left\{ - \left( \frac{1}{2} \right) \frac{e^2}{1} \left( \frac{1.3}{2.4} \right) - \frac{e^4}{3} \left( \frac{1.3.5}{2.4.6} \right) \frac{e^6}{5} \right\} \text{ etc.}$$

where  $a$  is the semi-axis major, and  $e$  the eccentricity.

**Cir'cumflex**, in grammar, one of the three accents, formed by the union of the other two, thus,  $\sim$ . It originally denoted a rising and falling of the tone in the pronunciation of the syllable. It is not used in English, and in French is usually a sign of the elision of a letter, and therefore indicates a prolonged sound.

**Cir'cumlocu'tion Office**, a name used by Dickens, in 'Little Dorrit'; he applies it to the delay and slowness of British officialism and especially when dealing with poor and friendless persons, imprisoned for petty offenses.

**Cir'cumnu'tation**, the continuous motion of every growing part of a plant, in which it describes irregular elliptical or oval figures. The apex of the stem, for instance, after pointing in one direction, moves round till it points in the opposite direction, and so on continuously. The term circumnutation was first used by Darwin.

**Circumpo'lar Stars**, stars near the Pole that appear to move around it, and perform their circles without setting. A star whose polar distance is less than the latitude of a place will never set at that place. They are constantly used by astronomers in connection with meridian work for determining the correction to be applied to transit observations to free them from the errors due to the slight departure of the line of collimation of the instrument from the plane of the meridian as it revolves on its axis. The pole-star Polaris or Alpha Ursæ Minoris, usually known as the North Star, is the most used for that purpose.

**Circumstantial Evidence**, evidence which tends to prove a particular fact by the proof of other facts, from which it is concluded that the particular fact must have happened. It is the natural and reasonable inference resulting from facts which have been established.

If A is on trial for the murder of B, and a witness testifies that he saw A shoot B, and a few minutes later B died, that would be direct evidence; whereas if the witness testified that B had been shot, and the bullet found in the body of B was of a particular make only used by A, and that A was in the neighborhood at the time of the shooting, the jury might infer that A was guilty; but if A could

## CIRCUMVALLATION — CIRCUS

prove that his pistol had been stolen from him shortly before the shooting, and he had not recovered it at the time of the shooting, it would be a complete defense, and the verdict would depend on the credibility of the witnesses.

Circumstantial evidence is of two kinds: that from which a certain conclusion necessarily follows, and that from which a certain conclusion is only probable or likely. If the body of a man is found with a bloody right hand impression on a part of his body where it is impossible for him to put his right hand, the presumption is that some one was present at or since the time the person was hurt; but if that is all of the evidence, it is impossible to tell whether the bloody impression was made by the person at the time of the assault, or by some one after the assault had been committed. In civil cases the jury may decide according to the weight of the evidence; but to convict a person of a crime the evidence must be such as to leave no reasonable doubt as to his innocence. See LAW, CRIMINAL.

**Cir'cumvall'a'tion**, a fortification consisting of a parapet of earth and a trench, constructed by a besieging army around its camp, to guard against attempts to relieve the place besieged.

**Circus**, a word which has come down to us from the Latin without change, meaning "circle," and used by the Romans to indicate the place in each city where chariot races, gladiatorial contests, and feats of skill were held. The circus building in Roman times was without a roof, rectangular in shape, except that one short side formed a half-circle; on both sides, and on the semicircular end, were the seats of the spectators, rising gradually one above another, like steps. The largest of these buildings in Rome was the Circus Maximus, 1,875 feet long and 625 feet wide, and capable, according to Pliny, of containing 260,000 spectators. At present, however, but few vestiges of it remain, and the circus of Caracalla is in the best preservation. Grown great through conquest of other peoples, the Romans of 2,500 years ago (and for 10 centuries later) encouraged all forms of pleasure which would develop to its highest pitch the fighting instinct in their soldiery. Among the circus games were chariot races, a favorite sport of the Romans; athletic contests; the Trojan games, contests on horseback; and combats with wild beasts in which beasts fought beasts, or beasts with men (either criminals or volunteers). The prizes given to the victors were often valuable, and the honors great. In the decadence of Rome came a decline of the circus, and it was frequently debased by revolting spectacles, in which Christians or others temporarily hated by the government were given over to wild beasts, or crucified. Julius Cæsar dug ditches around the circus and filled them with water. This served the double purpose of protecting the spectators from the sudden swerving of a chariot or spring of a tiger, and of making possible the novelty of feats of skill on the water. Most of the vessels then were propelled entirely by banks of oars, and Cæsar held rowing-races, swimming-races, etc. Most of our grotesque picnic-games, like swimming in a barrel or running in a sack, are relics

of his fertile inventions to please his restless, turbulent people. There was no charge to see these entertainments, as a rule, the circus being used as a pacifier by the emperor.

America has taken the lead in the reproduction of the Circus Maximus. This is probably because the American people are of a similar strenuous, contest-loving, restless disposition. It was his acute perception of this disposition in his countrymen that led Phineas Taylor Barnum (q.v.) a Connecticut Yankee, to devote his life to entertaining his countrymen by giving them a real circus. He first started the American Museum at the corner of Broadway and Ann street, New York, a site now occupied by the 20-story St. Paul Building. Soon he began to exploit all kinds of freaks and curious human beings, "Tom Thumb" and other dwarfs being among his features. He saw the greed of the public for odd, grotesque things. "The public loves to be humbugged," was one of his frequent declarations. Yet Barnum always gave the people what he promised, and soon had on the road the beginning of what has since become perhaps the largest "show" on earth. Since Barnum's death, the circus has been directed by Mr. Bailey, his partner for some years previous to that event. The magnitude of the Barnum & Bailey circus and menagerie can scarcely be described. It is usually formed by making three immense rings, three different performances being given simultaneously. With 1,000 performing horses, 2,000 horses to haul the tents and equipment from town to town, hundreds of wild beasts in a menagerie, 500 performers, bare-back riders (both sexes), clowns, aerialists, tumblers, etc.—1,200 other employees to care for the animals and erect the tents (seating 25,000), put up show-bills, etc., advance agents, cashiers, managers, and other attachés, bringing up the total to about 3,000 people employed during the season, the conducting of such a circus requires consummate ability and great pecuniary resources. A dozen trains of cars are necessary to carry this exhibition, and a whole ship is used when it visits Europe, as it often does, successfully. The capital invested in this and other circuses in America is enormous, being not under \$100,000,000. There are 8 or 10 of the very large circuses, and 20 more smaller ones at work in America at present (1903). The admission price to the common seats was primarily fixed by Barnum at 50 cents, and this has never been varied from since. The better seats, near the centre, are \$1.00. These seats correspond to those of the Roman emperor and his court in the old Circus Maximus. Vast crowds attend these exhibitions, particularly in the rural districts, where "circus day" is as much of a holiday as 4th July. Unless a continuous season of rainy weather is encountered, the profits accruing to the proprietors of these circuses at the end of the season (about October) are usually 100 per cent or more.

Since about 1890 there has developed a peculiar American form of circus which is worthy of mention. This is a reproduction in the ring of the habits and customs of the "cowboy" and pioneer of our own western plains. The exhibition is termed a "Wild West" show. It was originated, practically, by William F. Cody (q.v.), known on the plains as "Buffalo Bill."

He was a former government scout, and thus became familiar with many Indian tribes. With the aid of "Nate" Salisbury he organized an exhibition of frontier and Indian life which rivals Barnum & Bailey's in point of interest and profit. He has a hundred western cattle-herders, who give marvelous illustrations of the perfect horsemanship of the plains; he has many American Indians from a score of tribes, who give their war-dances and weird chants; he has Mexican lariat-throwers, who perform wonderful feats with a swirling rope; he has "rough riders" from many lands. Altogether, this makes a "show" which appeals powerfully to both the young and the old American. Several less important "Wild West" have also been organized.

Some American college youth have recently endeavored to revive interest in the ancient Grecian Olympic games. A delegation of them went to Athens in 1902 to compete with the modern Greeks and other national champions. These efforts may eventually rehabilitate the hippodrome and Circus Maximus in the lands which gave them birth.

**Cirencester**, sis'ĕ-tēr, England, a town in the county of Gloucester, on the river Churn, 18 miles southeast of the city of Gloucester. The chief industries are malting, brewing, and cutlery manufacture; it also has a large wool trade. The town contains the remains of the gateway of an abbey founded in 1177; and several churches of interest. In the environs is the well-known Royal Agricultural College, with a large number of students coming from all parts of the world. Cirencester was founded by the ancient Britons, and later, under the name of Corinium, became a Roman station. Various Roman remains, including those of an amphitheatre, have been discovered in it, and numerous relics belonging to this period of its history have from time to time been found and placed in the local museum. It was the scene of engagements during the civil war of the 17th century. Pop. (1901) 7,530.

**Cirillo, Domenico**, dō-mā-nē'ko chē-rē'l'lo, Italian republican and naturalist: b. Grugno, Naples, 1734; d. Naples August 1799. He officiated in early life as professor of botany, afterward accompanied Lady Walpole to France and England, became a Fellow of the royal society of London, a friend of Buffon, D'Alembert, and Diderot, and on his return to Naples was appointed physician of the court. After the proclamation of the republic by the French, he was chosen representative of the Neapolitan people, and member of the legislative commission (1799); and on the re-establishment of royalty suffered death on the scaffold, rather than take the oath of allegiance or ask a pardon from King Ferdinand. His principal writings are: 'Fundamenta Botanica' (1787); and 'Entomologiae Neapolitanæ Specimen' (1787); folio.

**Cirl-Bunting**, sēr'l'ĥun'ting, a small and very handsome European bunting (*Emberiza cir-lus*), rare and local in England, often kept as a cage-bird, though its song is slight.

**Cirpan**, cher'pān, a town of eastern Rumania, Bulgaria, on the tributary of the Maritza, 30 miles east of Philippopolis. It is situated in a fertile, fruit-producing region and is noted for its mineral springs. Pop. 11,069.

**Cirque**, sêrk, the name applied to basins occurring in mountainous regions at the head of narrow stream valleys and gorges. They are characterized by precipitous walls, which curve around in a semicircle, forming a natural amphitheatre. Their origin may be traced to the erosive action of converging glaciers and stream-lets.

**Cirrhosis**, sî-rō'sîs, a process of chronic, inflammatory reaction in an organ, due to some form of constant irritation. It is characterized by the excessive production of connective tissue in the part, which increase of connective tissue gradually encroaches upon the blood-vessels of the organ and slowly invades its essential portions. Cirrhosis may occur in almost any portion of the body, but it is characteristically present in only those organs which are rich in functioning parenchyma, such as the kidney, liver, spleen, pancreas, and brain. In each of these organs it produces a very definite form of lesion, with a clearly defined clinical course and history. Thus, in the kidneys, cirrhosis constitutes one of the forms of Bright's disease or chronic nephritis (q.v.). Cirrhosis of the liver results in a well-defined form of liver-disease, or chronic cirrhotic hepatitis (q.v.). Cirrhosis of the spleen, and cirrhosis of the pancreas also occur, and there is a well-known form of cirrhosis of the brain associated with degeneration. (See GENERAL PARESIS.) These different forms of cirrhosis will be discussed under their separate headings.

**Cirripedia**, an order of entomostracous *Crustacea* (barnacles), sometimes ranked as a sub-class, always fixed in the adult stage, but with free-swimming larvæ having three pairs of appendages (*nauplius*) like other *Crustacea*. The typical barnacles have the body enclosed in a reduplication of the skin which secretes a calcareous shell, on which account they were classed with the *Mollusca* until the discovery of their free-swimming larvæ led to a closer investigation of their structure. Owing to adaptation to a sedentary life segmentation of the body has become obscure, and the six pairs of jointed biramous appendages are mere fringed scoops for creating currents in the water. The eyes and other sense organs have likewise degenerated, and most species are hermaphroditic. The barnacles are exclusively marine, and a great many are parasitic.

Four sub-orders are distinguished: (1) *Thoracica*, including the typical, free-living, shelled barnacles of which the sessile forms (*Balanidae*, *Coronulidae*, etc., are well known as rock and ship barnacles in which the animal is protected by a conical shell formed of several pieces, with a multivalve conical movable lid, having an opening through which several pairs of long, many-jointed, hairy appendages are thrust, thus creating a current which sets in toward the mouth. The young have oval bodies, with a single eye, a pair of antennæ, with three pairs of legs. After swimming about for some time it attaches itself by its antennæ to some object, and now a strange backward metamorphosis begins. The body becomes enclosed by two valves, the stalk by which it is anchored grows larger, the feet become more numerous, and eventually the barnacle shape is attained. The goose-barnacle (*Lepas*) is not sessile, but is flat and triangular, and attached to floating bits

## CIRRUS — CISSAMPELOS

of wood or seaweed by a long, large, soft stalk. (2) *Abdominalia*, parasitic barnacles, in which the sexes are separate and very unequal in size. In this group is presented the remarkable phenomenon of dwarfed complemental males discovered by Darwin. The females live in burrows in the shells of mollusks and other barnacles, while the males are minute, lack mouth, digestive canal, and appendages, and live, often several together, permanently attached to the female. (3) The *Apoda*, whose body is maggot-shaped, are hermaphrodite and parasitic in other barnacles. (4) *Rhizocephala*: This group presents perhaps the most extreme cases of degeneration, through parasitism, known among animals. *Sacculina*, which attaches itself to the abdomen of the crab, is little more than a bag of genital organs which draws its nourishment from the tissues of its host by means of branching root-like processes which penetrate to every part of its body. Consult Darwin, 'Monograph of Cirripedia.'

**Cirrus.** See CLOUD.

**Cir'rus**, in botany, the tendril by means of which certain plants climb, usually a modified leaf or the prolongation of a midrib.

**Cirta**, sir'tà, a city of northern Africa, the capital of the Numidian prince Syphax, and an important fortress of Masinissa and his successors. Later it became a flourishing Roman colony. It was much injured by the troops of Masentius in 310 A.D., but was restored by Constantine and named Constantina. The modern Constantine occupies its site.

**Cisal'pine Republic**, Italy, a former State in the northern part. After the battle of Lodi, May 1796, Gen. Bonaparte proceeded to organize two states—one on the south of the Po, the Cispadane Republic, and one on the north, the Transpadane. These two were on 9 July 1797, united into one under the title of the Cisalpine Republic, which embraced Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona, and Rovigo, the duchy of Modena, the principalities of Massa and Carrara, and the three legations of Bologna, Ferrara, and the Romagna. The republic had an area of more than 16,000 square miles, and a population of 3,500,000. The seat of the government or Directory was Milan. The army consisted of 20,000 French troops, paid by the republic. The republic was dissolved for a time in 1799 by the victories of the Russians and Austrians, but was restored by Bonaparte after the victory of Marengo, and some modifications of constitution were made and the area was increased. In 1802 it took the name of the Italian Republic, and chose Bonaparte for its president. In 1805 the republic sent a deputation to Napoleon, with authority to give him the title of King of Italy. The territory was known as the kingdom of Italy until 1814. In 1815 it became a part of Austria. It is now a part of the Italian kingdom.

**Cisco**, sis kō, a local name, probably from the Indian language, applied to several species of fresh-water fishes of the family *Salmonidae* (q.v.) and closely allied to the white-fishes (q.v.), with which they are sometimes placed in the genus *Coregonus*, or separated under the name *Argyrosomus*. They are distinguished from the true white-fishes by having the lower

margin of the premaxillary bone horizontal instead of vertical, and by the larger mouth. Nine or ten species have been described from North America, most of them belonging to the waters of particular lakes or lake systems. The most important is *A. artedii*, which is found in the Great Lakes and adjoining regions, being represented in the small lakes of Indiana and Wisconsin by a slightly modified race. Under the name of lake herring it is the object of an extensive fishery on the lakes, second in value only to that of the true white-fish. It is a voracious fish, swimming in large schools, frequenting deep waters during most of the year, but spawning in the shallows during the winter. The other species inhabit various lakes and the river systems of Alaska, etc. Similar species also occur in Europe and Asia.

**Cisleithan** (sis-lí'thān) **Provinces**, Austria proper or Austria west of the river Leitha, which partly forms the boundary between it and Hungary. This portion of the Austro-Hungarian monarchy contains about 115,850 square miles. Pop. (1900) 26,107,304.

**Cisleithania**, a river on the boundary line between Austria and Hungary.

**Cisneros-Betancourt**, thēs-nā'rōs bē-tōn-koor', **Salvador**, Cuban patriot: b. Puerto Principe 1832. He was a descendant of one of the best families of Spanish nobility, and possessed the hereditary title of Marquis of Santa Lucia. During the revolution of 1868-78, he was president of the Cuban House of Representatives, and during a part of the time president of the Cuban republic. In 1895 he was re-elected president of the new Cuban republic. His niece, Evangelina Cosío Cisneros, was imprisoned by the Spaniards for aiding the insurgents during the insurrection in 1896-7, and made a sensational escape, coming to the United States, where she became a protégé of Mrs. Gen. John A. Logan. His daughter tendered her services to the United States as an army nurse during the war with Spain in 1898.

**Cispadane** (sis-pā'dān) **Republic**, Italy, a republican state established by Napoleon in 1796, after the battle of Lodi. It comprised Bologna, Modena, Ferrara, and Reggio. In 1797 it was united with the Cisalpine Republic (q.v.).

**Cisplaine** (sis plā'tin) **Republic** (Lat. *cis*, on this side, and Sp. *Plata*, name of the river on the boundary between Uruguay and Argentina). The Republic of Uruguay was called by this name from 1828 to 1831. Previous to becoming an independent state it had belonged to Brazil, and was called Cisplaine Province.

**Cisrhenish Republic**, or **Cisrhenam Republic**, several towns on the Rhine, particularly Cologne, Aix-la-Chapelle, and Bonn, at the time when so many republics were created, declared themselves independent, under French protection, and took the title of *Cisrhenish Republic* in September 1797. But at the Peace of Campo-Formio (17 Oct. 1797), the left bank of the Rhine, including the Cisrhenish Republic, was ceded to France by a secret article, and the confederation bearing this name is in consequence hardly known.

**Cissampelos**, a tropical genus of climbing shrubs of the natural order *Menispermaceae*,

whose growth is similar to that of an ivy vine. The plant is of great commercial value because of its medicinal qualities, especially the velvet-leaf of Brazil, (*Cissampelos pareira*), the root of which supplies the spurious pariera brava, abuta root, used in medicine as a tonic. Other species growing in nearly all tropical countries are used for emetics and cathartics, and an East Indian species (*C. oblecta*) yields an intoxicating spirit.

**Cissey**, sê'sā, **Ernest Louis Octave Courtet**, French general: b. Paris 1811; d. there 1882. He was educated at the military school of St. Cyr and having served with distinction in Algeria and the Crimea, he was promoted in 1863 to be general of a division. He fought in the Franco-Prussian war, and in the contest against the Commune of 1871. He was elected to the National Assembly in February 1871, and was minister of war from 1871 to 1873, and in 1874-6. He was elected life senator in 1875.

**Cis'soid**, a curve in geometry, the locus of the vortex of a parabola rolling upon equal parabola. If pairs of equal ordinates be drawn to the diameter of a circle, and through one extremity of this diameter and the point in the circumference through which one of the ordinates is let fall, a line be drawn, the locus of the intersection of this line and the equal ordinate is known as the cis'soid. This curve was discovered by Diocles while he was seeking the solution of the celebrated problem of the duplication of the cube.

**Cist**, **Henry Martyn**, American soldier: b. Cincinnati, Ohio, 20 Feb. 1839; d. Rome, Italy, 17 Dec. 1902. He graduated at Belmont College 1858, and began the study of law, but enlisted as a private in the Sixth Ohio Regiment 21 April 1861, attaining, before his resignation 4 Jan. 1864, the brevet rank of brigadier-general. He was post-adjutant of Camp Chase during the imprisonment of the Confederates captured at Fort Donelson, assistant adjutant-general of the Army of the Cumberland, and later, on the staff of Gens. Rosecrans and Thomas. After the war he practised law in Cincinnati, was twice mayor of College Hill, originated the project that resulted in the conversion of the Chickamauga battlefield into a national park, and was a contributor of military articles to the magazines. He wrote 'The Army of the Cumberland' (1882); and collaborated with Donn Piatt in a 'Life of General George H. Thomas.'

**Cist**, a place of interment of an early or prehistoric period, consisting of a rectangular stone chest or inclosure formed of rows of stones set upright, and covered by similar flat stones. Such cists are found in barrows or mounds, enclosing bones. In rocky districts cists were sometimes hewn in the rock itself. See BURIAL; BURYING PLACES.

**Cistaceæ**, sis-tă'se-ē. See CISTUS.

**Cistercians**, sis-têr'shê-āns, a monastic order in the Roman Catholic Church founded in 1098 by St. Robert of Molesme, a Benedictine monk of Cluny (q.v.) at Cistercium, near Dijon in France. After a year Robert of Molesme was succeeded as abbot by the monk Alberic and he in turn by St. Stephen Harding, an Englishman, who ruled the order during 25 years with great wisdom and who is regarded as its

second founder and lawgiver: his day in the Church calendar is 17 April. The Cistercian order in his time grew to be the most considerable monastic order in the Church, and to him in great part is due the founding of the four greatest Cistercian monasteries of France, next after Cîteaux, namely, La Ferté, Pontigny, Clairvaux, and Morimond. By the middle of the 12th century Cîteaux had affiliated to it 500 abbeys and priories, and early in the 13th their number was 1,500, of which very many were convents or priories of Cistercian nuns. For 200 years the austere rule of St. Benedict as reinforced by St. Stephen Harding was maintained throughout the order: there was the chanting of matins and lauds at midnight throughout the year in the abbey or priory church; there was a strict fast on one slender meal from 14 September to Easter; there was abstinence at all times (cases of sickness excepted) from all animal food, save that very rarely milk was allowed. The austerity of the Cistercian rule extended even to the churches of the order: simplicity was sought in everything; there was no fatuous display of ornamentation, either of the edifice or of the vestments, or of the sacred vessels; the copes and chasubles employed in the church services were of white linen instead of silk or cloth of gold; the chalices and the pyxes, instead of being of gold incrustured with precious stones, were of plain silver. But the church schisms and the wars and civil commotions of the 14th century led to the plundering of the abbeys and priories, and the monastic discipline was greatly relaxed, so that on the one hand it became necessary for the see of Rome to sanction in some respects this relaxation, while on the other hand there arose zealous upholders of the ancient rules who brought back the primitive observance in all its rigor. Among the most notable of these revivers of the ancient rule was the abbot De Rancé of the monastery of La Trappe (q.v.) in the 17th century. At the dissolution of the English monasteries by Henry VIII. there were in England and Wales 115 Cistercian houses, of which 25 were for nuns. In the period of the French Revolution most of the Cistercian Cenobia, not only in France, but throughout the continent of Europe, were suppressed. In the United States there are two Cistercian abbeys, namely, that of La Trappe at Gethsemane in Kentucky, and that of New Melleray, near Dubuque, in Iowa. The most noted English Cistercian's houses were the abbeys of Furness, Fountains Rievaulx, Tintern, Kirkstall, and Woburn. A modern English Cistercian abbey is situated at Mount Saint Bernard, not far from Leicester. See JANAUSCHEK, 'Origines Cistercienses' (1877); Guignard, 'Monuments primitifs de la règle Cistercienne' (1877); Sharpe, 'Architecture of the Cistercians' (1874); Lefroy, 'Ruined Abbeys of Yorkshire' (1889); Eulart, 'Origines de l'architecture Gothique en Italie' (1893).

**Cistern**, a tank for holding water. Cisterns differ from wells in that they do not get their water from natural sources, such as springs, but through channels made by the hand of man. In hot countries, where the supply of water is not regular, or where rain water is used, cisterns are necessary for storing up water for future use. They are also largely used for the

supply of locomotive boilers at railroad stations. Cistern water used for drinking is usually filtered.

**Cistus**, the typical genus of the rock rose family (*Cistaceæ*), a family having four genera, and about 160 species, of which two at most are found outside the northern hemisphere. The American representatives of the family belong to the genera *Helianthemum*, *Hudsonia*, and *Lechea*, most of the species being pestiferous plants, such as the frost-weed or Canadian rock rose (*H. canadense*), poverty-grass (*Hudsonia ericoides*), and the pin-weeds (*Lechea*). *Cistus* does not grow wild in America, but some species are cultivated in greenhouses and the warmer regions for the beauty of their large wild rose-like flowers, which are often of two colors. This genus, which is a native of the countries of Europe, is generally a beautiful evergreen flowering shrub, ornamental in gardens or shrubberies. Gum ladanum is obtained from *C. creticus*, and *C. ladaniferus*. This gum was formerly used as an external stimulant in plasters, but is now almost obsolete in medical practice.

**Cit'adel** (from the Italian *cittadella*, a diminutive of *città*, city; signifying little city), in fortification, a kind of fort, consisting of four, five, or six sides, with bastions, commonly joined to towns, and sometimes erected on commanding eminences within them. It is distinguished from a castle by having bastions.

**Citation**, a summons or official notice given to a person to appear in a court as a party to a cause. A writ issued out of a court of competent jurisdiction, commanding a person therein named to appear on a day named and do something therein mentioned, or show cause why he should not. Proctor, Prac.

In cases in which a citation issues it is generally the writ commencing the action, the same as a summons in trespass or a bill in equity. The citation is used by courts having control over the estates of the dead.

**Cithæron**, sî-thê'rôn, or **Elatea**, a mountain, Greece, which stretches northwest, separating Bœotia from Megaris and Attica. Its loftiest summit rises 4,620 feet above the sea, and is the subject of numerous fables and classical allusions. On its northern slope stood the ancient city of Platæa, the circuit of whose walls may still be traced. Its modern name Elatea, from *elatê*, a fir, is derived from the pine forests which are abundant on its sides and summit.

**Cithara**, sîth'a-ra, a guitar-like musical instrument, said to have been invented by Apollo. The strings, usually five or six in number, were struck with a plectrum, or picked with the fingers, sometimes both methods being used at the same time. It was the forerunner of the banjo, guitar, zither, and all similar instruments. See LYRE.

**Cities of the Plain**, Sodom and Gomorrah, chief of the five cities which, according to the commonly received account, were destroyed by fire from heaven, and their sites overwhelmed by the waters of the Dead Sea.

**Cities of Refuge**, according to the law of Moses six out of the 48 cities which the Israelites were directed to give to the tribe of Levi, in the division of the land of Canaan among their tribes, were to be set apart as cities of

refuge for the manslayer or accidental homicide. The right of avenging murder belonged to the next-of-kin of the murdered man; but the slayer fleeing to one of these cities, three of which were to be on either side of Jordan, the avenger of blood was forbidden to touch him till he stood before the congregation in judgment; when, if he were found to have acted without premeditation or malice, he had a residence appointed him in the city of refuge until the death of the high priest, and was then permitted to return to his inheritance. If the slayer violated this regulation by leaving the city of refuge before the death of the high priest, the avenger of blood might kill him with impunity. The six cities of refuge appointed in accordance with this law were Kedesh, Shechem, and Hebron on the west side of Jordan; and Bezer, Ramoth-Gilead, and Golan on the east. This law of refuge seems to have been favored by the Levites, to whom it gave a measure of political influence, much in the same way as the privilege of sanctuary did to the monks, abbots, and other dignitaries of the Roman Catholic Church; it was consequently interpreted by them in the most liberal way. Maimonides says that all the 48 cities of the Levites had the right of refuge, although only the six were obliged to receive and lodge the slayer gratuitously.

**Citizen**, originally, a member of the body of freemen entitled to share in the government of a *civitas*, or city-state of the ancient type; as the Roman state gradually broadened into the entire ancient world, the citizenship was extended piecemeal for political reasons, till Justinian made it coextensive with personal freedom, and the attribute of all residents of the empire except slaves. With the rise of the miscellaneous modern community, where flux of population permanent and temporary is going on, and the mass of people share in the government to a varying extent, the question of its limitations and the privileges it confers have become acute, and that of its legal definition has furnished one of the grounds of a civil war. The definition varies in different countries. In monarchies it is commonly used only of a resident's relation to his municipality, the term "subject" expressing the relation to the state; in republics generally it means a regular member of the community, subject to its ordinances, obligated to its support and defense, and entitled to its protection. In the United States, a complication is introduced by the federal structure of the government, there being a citizenship of each distinguished from that of the other. The questions arising in this country are therefore: (1) What constitutes citizenship; (2) What rights it confers; (3) How it is acquired; (4) How it can be lost; (5) What are the respective obligations to State and nation.

1. A citizen has been legally defined as "one who owes to the government allegiance, service, and money by way of taxation, to whom the government in turn grants and guarantees liberty of person and of conscience, right of acquiring and possessing property, . . . suit and defense, security in person, estate, and reputation." In a word, the citizen is one whose lot is cast in with his society, for all social purposes according to his status and means, to fight or pay unless he is a dependent member of a group which fights, pays, etc. This includes

## CITIZEN KING — CITIZENS' INDUSTRIAL ASSOCIATION

women, children, defectives, and criminals; and excludes alien residents (see, however, section 3), and Indians living in tribal relations, who are "dependent subjects." It should be added, however, that for jurisdictional purposes resident aliens are regarded as citizens, and in commercial and business legislation "citizen" is equivalent to "resident."

2. Citizenship implies civil but not necessarily political rights. The former are one for all, and are the primary obligation of a government to secure to its members; political rights are endlessly varied and within the discretion of the government. The right of direct share in government is everywhere withheld from minors, convicts, and the insane or idiotic, nearly always from paupers, and most generally from women; but these do not cease to be citizens. On the other hand, voting has occasionally been permitted in this as in foreign countries to persons not citizens of a State or municipality, for holdings of property, and could be so again. It was on this distinction that the minority in the Dred Scott case based their dissenting opinion that a slave's lack of political rights did not prevent his being a citizen with a right to sue in the courts; and the government by the Fourteenth Amendment ratified this view, and definitely dissociated civil from political rights.

3. Citizenship may be acquired by birth, every child born on the soil or within the jurisdiction of the United States,—even of resident aliens, except of foreign official representatives, whose residences are assumed to be part of their country's territory,—or of citizen parents traveling abroad, or of its officials resident abroad, being a citizen; or by naturalization; or by succession to a parent's or husband's rights,—the wife of an alien becomes a citizen by his naturalization, or after his death before naturalization if he had previously declared his intention of becoming so; and the children inherit similar rights.

4. It may be lost by formal renunciation, but the abandonment will not be presumed without it, even from a lifetime of residence abroad; but the government, with most civilized governments at present, recognizes full right to change allegiance at will. This was one of the issues in the War of 1812. Great Britain firmly refusing to recognize it; and it was not till 1870 that that country formally admitted that right.

5. Dual allegiance. The nature of the obligations is different: any one may be a citizen of the United States, yet not of any particular State, but not *vice versa*; and as the citizenship of the nation is the more universal, so it is of the higher sanction. The two could not in fact come into conflict except through an act of secession, which must be fought out, so that the question is academic, as short of that the whole matter would involve a case in the supreme court, pending which the question would be in abeyance; but in case of forcible resistance of a State to a decree of the nation, the citizen's first allegiance is to the latter. Further than this, however, the national government cannot go beyond the scope of its reserved powers; and a State can go very far in the direction of abolishing even the civil rights of its citizens under the shelter of this flexible permission. It should be noted that the right of citizenship is

totally unconnected in essence with the right of suffrage or the elective franchise. The former is an elemental right of all born among, or who have cast in their lot with, a civil society; the right to the protection of its laws and its strength, to a share in its benefits and its charities. The latter, a right to share in the governmental management of a society, is a mere question of the best machinery of management, and dependent on the fitness or power of individuals or classes to help guide that machinery. The unfit or weak are just as much citizens as the fit or the strong, by natural right; women and minors, defectives and criminals, have the fullest right to claim the protection of the laws, by themselves or their natural or appointed guardians. The suffrage is only a substitute for a battle, assuming that the larger body could outfight the smaller; and admission to it lies in the discretion of the fighting body.

**Citizen King**, The, a title applied to Louis Philippe, king of the French, 1830-48.

**Citizen of the World**, the signature of Oliver Goldsmith's 'Letters from a Chinese Philosopher residing in London, to his friends in the East.' The work was published in 1762.

**Citizens' Industrial Association of America**, The, a national federation of local employers' associations, citizens' alliances, and State and national organizations representative of business interests, organized as the culminating step in the movement for the organization of employers in 1903. Nearly all the large cities, and scores of the smaller ones, during the months following the anthracite strike of 1902, became the centres of considerable agitation on the labor question, and from 400 to 500 local associations sprung into existence for the purpose of combating what was termed the lawless aggressions of organized labor. The membership of some of these associations was confined to employers, while others, which adopted the general name of alliances, admitted professional men, and even employees, into their ranks. In cities like Chicago, Saint Paul, Omaha, Kansas City, Saint Louis, Detroit, Cincinnati, Louisville, and New York employers' associations were formed, while in Denver and all over Colorado and many other parts of the West, as well, also, in the smaller towns of the Central States, the alliance was the most popular form of organization. In response to a call issued by a number of the prominent leaders in the employers' movement, a convention was held in Chicago, 29-30 Oct. 1903, which was attended by nearly 300 delegates, who came from all parts of the United States and Canada, cities as far apart as San Francisco, New Orleans, Montreal, and Minneapolis being represented. The name of the Citizens' Industrial Association was considered as being inclusive in meaning of both employers' associations and citizens' alliances, and was selected by the convention for the new organization. The purposes, as set forth in the constitution adopted, were those of law enforcement, the maintenance of individual liberty, the securing of industrial peace, and the perpetuation of free competitive conditions in industry. The organization stands for the open shop, and no restriction of output. Its work is largely confined to that of educational propaganda, and it maintains a publication bureau for this purpose.

It does not interfere in any respect with the internal government of its constituent associations, and the action of its convention or executive committee is advisory and not obligatory upon its members. The association forms a central source of information for its members and a directing agency in matters of national legislation in which the associations generally are interested. In the contest in the present Congress over the eight-hour and anti-injunction bills, which are fathered by organized labor, the Citizens' Industrial Association is taking an active part. The National Association of Manufacturers is a member and one of the principal elements of support in the new organization. Its president in 1904, David M. Parry, was chosen by the Chicago convention as the first president of the association. The secretary, chosen by the executive committee, was A. C. Marshall, of the Dayton Employers' Association, Dayton, Ohio. Vice-presidents were J. C. Craig, of the Denver Citizens' Alliance, and J. T. Hoile, of the New York Manufacturers' Association, with offices in Brooklyn. The treasurer in 1904 was Major A. C. Rosencranz, of the Evansville Alliance.

DAVID M. PARRY,

President Citizens' Industrial Association.

**Citizen**, The a comedy by Arthur Murphy, performed 2 July 1761, at the Drury Lane Theatre, and printed in 1763. It is founded in part on Destouche's 'Fausse Agnès.'

**Citric Acid** ( $C_6H_8O_7 \cdot H_2O$ ), a very widely distributed acid, present in most common fruits, such as gooseberries, currants, lemons, citrons, cherries, and many others. It was first separated and distinguished by Scheele in 1784. It is generally prepared from lemon juice, the dark treacle-like fluid imported from Sicily, by fermenting it, filtering, and neutralizing with chalk and quicklime, by which citrate of calcium is precipitated. This, by decomposition with sulphuric acid, gives the acid, which is then purified by repeated crystallization. Several improvements have of late been introduced, both in preparing the crude lemon juice for exportation and in the subsequent purification and crystallization of the acid. Citric acid is white when pure; it crystallizes in two forms, one belonging to the trimetric system is the common form, and in it the acid contains one molecule of water, as indicated in the formula given above. The other form contains half the quantity of water. The ordinary crystals effloresce in the air in a warm room. Citric acid has a pleasant sour taste. It dissolves very readily in water, and is soluble in alcohol, but insoluble in ether. When heated it undergoes decomposition, and yields aconite, itaconic, and citraconic acids, along with other products. It is acted on by nitric and sulphuric acids, and by other reagents, yielding a variety of decompositions and derivatives.

Citric acid combines with the metals, forming citrates. They are crystalline salts, and many of them are soluble in water. Crude citric acid is largely employed by the calico-printer as a resist and as a discharge.

Citric acid and the citrates are used in medicine as cooling drinks, as antidotes to alkalies, and for the purpose of rendering the urine alkaline, thus overcoming too great an acidity. Citrates of magnesium are used as laxatives and cathartics, and are among the most effi-

cient and pleasant of this class, being particularly adapted to children.

**Citron** (*Citrus Medica*, var. *genuina*), a bush or small tree of the natural order *Rutaceae*. It bears reddish or purplish slender branches; smooth, oblong leaves; externally reddish flowers; and large, warted or furrowed, oblong or ovate fruits with a very thick, tender, aromatic rind, which is candied or preserved and used in cakes or confectionery. The mildly acid juice of the pulp is used to some extent with sugar and water as a drink like lemonade, or for mixing with and flavoring various liquors. From India, where the tree is native, the citron has been introduced into many warm climates throughout the world. It is sparingly cultivated in California and southern Florida, but more generally in the West Indies more as a home than an orchard fruit. Most of the candied citron on the American market comes from the Mediterranean region of Europe, where the trees are extensively cultivated. All the varieties, which vary considerably, probably on account of hybridizing with other species, are very susceptible to injuries by frost. They may be propagated by layerage, graftage, or cuttage, the first producing trees inferior in form to those derived by the other two methods. The orchards should be located on well-drained land well exposed to sun and air, which aid in preventing the attacks of insects and fungi. Clean cultivation, liberal fertilization, and the use of cover crops during the hot months, are the three leading factors in the cultivation of this crop in Florida. In the United States, the name is also popularly applied to a variety of watermelon with an edible flesh and generally red seeds. This citron is frequently grown in northern private gardens and to a small extent commercially for its rind, which is used for preserving in various ways. See CITRUS; LEMON; LIME; WATERMELON.

**Citron-melon**. See WATERMELON.

**Citronella Oil**, an oil obtained from a kind of grass (*Andropogon nardus*), cultivated at Singapore and in Ceylon. It is used for scenting soaps. Other species of the same genus and some other allied genera also yield essential oils.

**Citronelle**, sīt-rō-něl', Ala., a village in Mobile County, where on 4 May 1865 the last Confederate army east of the Mississippi surrendered to the Federal troops under Gen. Canby.

**Citronwood**, or **Citrus-wood**, the most costly furniture wood of Roman antiquity, usually regarded as derived from *Biota* (*Thuja*) *orientalis*, or possibly from *Callitris quadrivalvis*, allied coniferous trees, both popularly known as *Arbor vitæ* (Oriental and African). Cicero is said to have paid an enormous sum for a table of this wood.

**Città Vecchia**, vĕk'kē-ā, or **Civita Vecchia**, a fortified city of Malta, near the centre, and almost on the highest point of the island, seven miles southwest of Valetta. Pop. 7,000.

**Cittadella**, chĕt-tā-dĕll'ā, Italy, city in province of Padua, compartimento of Venetia; 30 miles northwest of Venice. Portions of its ancient walls still remain. It contains beautiful churches and botanical gardens. Its mod-

## CITY

ern industries are the manufacture of paper and linen. Pop. 9,850.

**City** (Latin *civitas*). The Greeks and Romans distinguished a city from a town, or mere assemblage of people living together under municipal laws, as an independent community or state possessing sovereign authority, and including any portion of the surrounding territory the inhabitants of which possessed the rights of citizenship, but excluding conquered or dependent territories. Thus, Athens, Rome, and Carthage were all both towns and cities in different senses. In Europe the word city came to have two meanings, the one civil, the other ecclesiastical. The civil meaning corresponded with the Roman sense, in which the great Italian republics and the German free cities during the period of their independence corresponded with it. The fluctuations in the fate of such cities must necessarily have caused the word to lose the sense of territorial independence, and this change would be promoted by the rise of rivals to them in other respects having no such claim, so that in modern times a city has come to signify merely a town holding from extent of population, favorable situation, or other causes, a leading place in the community in which it is situated. The ecclesiastical sense of the term city is a town which is the see of a bishop. This seems to be the historical use of the term in England, and still possesses some authority there, but in general use it has been superseded by the wider one. In our historical retrospect we take the term in its least restricted sense. The origin of cities belongs to the earliest period of history. According to Moses Cain was the first founder of a city, and Nimrod built three, among which Babylon was the most important. The Jews imagine that Shem erected the first city after the deluge. At the commencement of society the form of government was patriarchal. The ruler was the head of the family or clan. Relationship, the innate wish of men to live in society, and more, perhaps, than both these causes, the necessity of providing means of defense against more powerful clans, brought together separate families into one spot. The fertility of the East also afforded facilities for men to give up the rambling life of nomads and to form permanent settlements. These settlers began to barter with those tribes who continued to wander with their herds from place to place. Thus cities sprung up. These were soon surrounded with walls to prevent the inroads of the wandering tribes. The bond of connection between their inhabitants thus became closer, and their organization more complete. As by degrees the chiefs of these family-states died away, the citizens began to elect the most able or most popular men for magistrates, without respect to birth or descent. Thus political institutions began to assume a systematic character. The earliest forms of government succeeding the patriarchal state was probably monarchical. In this the religious, paternal, and political authority remained rudely mingled. When conquest extended the limits of these early kingdoms the authority of the king was weakened, his connection with the different parts of his dominions became imperfect, and the progress of civilization was promoted almost solely by the growth of the cities. These

gave rise to the division of labor, the refinements of social intercourse, the development of laws caused by the conflicting interests of many people living close together, the idea of equality of rights, the diminution of awe for a distant monarch, the growth of patriotism, springing from the sense of advantages enjoyed and the exertions necessary to maintain them. These were the salutary consequences of the establishment of cities. Under the mild sky of Asia, Africa, Greece, and Italy cities were built first, and in the greatest number. The Phœnicians and Egyptians particularly distinguished themselves by the erection of cities, which soon attained a high degree of wealth, and consequently of civilization. The Egyptians considered their city of Thebes older than any of the Greek cities; and Pliny says that Cecropia, said to have been erected in Attica by Cecrops, 1582 B.C., and afterward called "Athens," was the oldest city of Greece. Heeren justly remarks that the rise of cities was the most important source of the republicanism of antiquity. This is particularly true of Greece. In fact cities are, by their very nature, of a democratic tendency. Several confederations of cities existed in the ancient world; for instance, the Phœnician, consisting of the cities of Tyre, Sidon, etc., and the Achæan league, formed by the most important cities of Greece, in order to strengthen themselves against the power of Macedon. Under Augustus and his successors the Romans began to establish colonial cities in Germany, having done the same long before in Gaul, Spain, Africa, etc. In Switzerland they first erected cities about 70 A.D., which, however, were mostly laid waste by the Alemanni, and subsequently rebuilt under the government of the Franks (496 A.D.). The Germans, accustomed to a wild, rambling life, did not show any disposition to live in cities until Charlemagne labored to collect them together in settled abodes from his desire to civilize them. Henry I. distinguished himself particularly in this way, and on this account has been called by some "Henry the City-builder" (*der Stadterbauer*). He gave the cities great privileges, in order to induce his subjects to live in them, and thus laid the foundation of that power which at a future period contributed most to break down the feudal system. In many cities imperial castles were erected to protect the inhabitants, and the insupportable oppressions and even cruelties exercised by the feudal lords upon their peasants, or by the wandering knights and robbers, drove many people into the cities. The attacks of the neighboring lords gave firmness to their union, and compelled them to cultivate their resources. Commerce and the various arts and trades were soon cultivated within their walls, and their wealth and respectability increased. They soon became sensible of the want of a better system of laws and political administration than prevailed around them, and the principle of equal rights and laws was quickly developed.

One of the most important remnants, if not the most important, of the great fabric of ancient civilization, was the cities of Italy. In spite of their bloody contests with each other, and the vices of an oligarchical government, Europe is mainly indebted to them for the cultivation of the commercial spirit, together with the toleration and love of liberty, which, under

the most unfavorable circumstances, it tends to foster, and for that arduous in the cultivation of arts, science, and literature, which has always distinguished the best periods of Italian history, and from which the general revival of learning in Europe, called the Renaissance, took its rise. Under the reign of Conrad III. (1138-52) the cities of Lombardy, and particularly Milan, which stood at their head, had acquired a high degree of wealth and power, and had formed themselves into a confederation. The struggles between the emperors and these cities form one of the most important portions of the history of the German empire and of Italy. Frederick I. in vain demolished the powerful city of Milan. It was soon rebuilt, and the cities of Lombardy, in alliance with the Pope, obliged the emperor to conclude with them a very disadvantageous peace at Constance. Two other confederations of cities, highly important, were formed during the interregnum of the German empire, between 1256 and 1272. One of them was the powerful Hansa, or Hanseatic League (q.v.), the other the confederacy of the High German and Rhenish cities, from the foot of the Alps to the mouth of the Main, established by Walpode of Mentz in 1255. A similar confederacy, and a very important one, was that of the Suabian cities, instituted in 1488 to repel the outrages of the feudal lords and knights. The cities of the Netherlands, from their central position between France and Germany, exercised a powerful influence on the growth of civilization and political liberty in Europe. Their favorable situation and the enterprise of their inhabitants early gave them great wealth and power. The democratic spirit, ultimately carried to the greatest height in Holland, was earliest manifested in the towns of Belgium, which began in the 12th century to manifest a turbulent disposition, and by frequently leaguering themselves with the enemies of their feudal superiors extended their political privileges, and acquired at times a premature independence, which, though ultimately extinguished in the spirit of nationality, contributed not a little to the breaking up of the feudal system (q.v.). In Spain municipalities were established at an early date. Leon received a charter in 1020, Sepulveda, Lograno, Sahagun, and Salamanca followed soon after. The constitution of the Spanish towns approached more nearly to the ancient idea of a city than was common in other large states of Europe, in this resembling the Italian cities. Their constitution was extremely democratic, and they ruled over a large extent of surrounding territory, which they were bound to defend. Deputies from the towns were admitted to the cortes in the 12th century (1167 and 1188). The love of liberty rose high in these ancient Spanish cities, but from the isolation of the Iberian Peninsula they exercised little influence in Europe, and they soon lost their power and importance, most of them by the end of the 15th century having ceased to send their representatives to the cortes. By degrees the cities acquired in the different countries of Europe the right of representation in the legislative bodies; and wealth, industry, knowledge, and equal laws spread from them through Europe. But the cities of Lombardy, though still flourishing and wealthy, had fallen, for the most part, under the rule of single families; their republican gov-

ernments vanished, and their confederation was dissolved. The associations of German cities experienced a similar fate. By the Peace of Westphalia the princes of the German empire were declared sovereign powers, and the more their authority increased the more did the relative weight of the cities diminish. These had formerly suffered from the oppressions of the feudal lords. They were now the victims of the policy of the neighboring princes, whom envy often led to adopt the most unwarrantable measures against the cities, many of which had lost their independence before Napoleon dissolved the German empire. He took away the privileges of those which remained free; and the Congress of Vienna restored freedom to Lübeck, Hamburg, Bremen, and Frankfort, only because the different powers could not agree to whom they should be assigned. At the same time Cracow was declared an independent city, with a republican form of government.

Cities, as we have seen, naturally develop the democratic principle, and on this and several other accounts are to be considered among the firmest supports of liberty. Well-organized municipal institutions, in which the government is in the hands of the citizens, afford continual nourishment to the spirit of freedom throughout a country.

In the United States a city is an incorporated municipality, usually governed by a mayor, alderman, and common council. In many of the States, especially the eastern, the number of inhabitants required for legal municipal incorporation is 10,000. In several of the western States a much fewer number is required. A village or town of 10,000 or more inhabitants is not obliged to become a city, and in several cases places of 20,000 and 30,000 have preferred, for local reasons, to remain under village government. In the United States cities are generally the outgrowth of villages, one village expands into a town with population sufficient to assume the duties of a city; but in several instances, villages near each other have united to form a city, and sometimes cities nearby have united in one municipality.

Much has been said and written upon the immorality of large cities, and it cannot be denied that they have vices peculiar to themselves; but it must be considered, on the other hand, that they are free from many of those of petty towns, and even of rural districts. The association of men in masses, when due surveillance is exercised, has an influence distinctly favorable to the maintenance of social order, the impartial administration of justice, and, above all, the suppression of all petty and local tyrannies, and the maintenance of individual liberties. It is by the influence of cities alone that a sufficient organization for the support of education and the means of enlightenment is obtained, even though that organization often fails to penetrate the entire mass of the cities themselves. It is to them that many of the facilities for progress in art and science are due. It is in them that public opinion is formed, and so organized as to act upon the administration, and, even independently of direct representation, upon the legislation of a country; and although the individual freedom enjoyed in great cities may often tend to license, its general influence in an otherwise healthy community is highly beneficial to the moral tone of the whole. It must, however, be

CITY MAKING.

PLAN AND BIRDSEYE VIEW OF A PROPOSED ARRANGEMENT FOR WASHINGTON, D. C.

## CITY-MAKING

admitted that the democratic spirit in cities is liable to be carried too far, and that an excessive growth of large towns might thus prove dangerous to the State.

As regards mortality, New York compares favorably with most of the larger European cities, of which St. Petersburg and Moscow have the highest death-rate (29 or 30). Cities in Great Britain and Canada seem to be much on a par with those of the United States. Asiatic cities stand much higher. See MORTALITY.

**City-making.**—Although in the history of the world, cities have occasionally sprung up by fiat and have thus been deliberately planned, giving scattered examples of practical city-making on a large scale and more or less satisfactory in character, the rule remains that most have usually grown by extension and accretion from smaller communities, and their growth has had no other law than the requirements of the moment and the unorganized practical and æsthetic impulses of individuals and corporations. The units of a community have always, indeed, united for common ends, but rarely with a conscious regard for a civic ensemble, and still more rarely with regard to the necessity of preserving to the community the means of further extension on lines foreseen toward a larger whole, of which the existing city should be a concrete and vitally related part. The surge of the population toward the great centres which has marked the rise of the industrial spirit and the enormous growth of the cities in the United States and Germany has brought the subject into clear prominence, and for the first time in history science has seized on this field and endeavored to trace the natural laws and phenomena of civic life and civic growth, and to point out to the practical worker the condition of his problem.

The modern science of city-making, then, has sprung up in answer to a manifold need in the cities of to-day. From the reorganization of the entire plan of a city like that being undertaken by the city of Washington, D. C., to matters of the discipline of the street in one form or another, its principles are becoming more and more clearly recognized in the minds of the people, and in the laws and regulations that are its outcome.

In the extension and widening of streets which, as originally planned, were too narrow for the traffic that has surpassed the hopes of the early founders, and in the parking treatments by which we try to counterbalance the aridity of the unbroken stone and brick, we have one of its fields which is most obvious. Another is seen in the growing sentiment that the fixtures on our streets must not be merely functionally suitable, but should also be at least neat in design and quiet in color, if they cannot have positive ornamental value. Along this line may also be mentioned the desire, on æsthetic, as well as practical grounds, for the burying of wires and the clearing of our streets of the forest of poles so destructive to the architectural beauty of a city. In the improved disposal of garbage and in street cleaning, a somewhat stronger position has been early assumed from the direct practical necessities of the case. It is in spacing and the insuring of breathing spots in our cities that a haphazard and unscientific method, one, indeed,

almost of accident, is to be clearly observed. No city of any importance is without its parks, but few have a park system, and in few cases is there evidence of anything but chance in their location. The science of city-making touches on questions of the control of private action at a number of important points. For instance, in Massachusetts, the trees along the sidewalk are considered so far a public benefit that the public interest in them is held to exceed that of the owner, and he may not remove or injure them except by official permission. In the attempt to restrain the voiding of immense clouds of bituminous smoke into the atmosphere, we have another example in point. The municipal oversight of architectural designs in this country, chiefly restricted to constructional features, is in foreign countries extended to a municipal oversight of designs from the architectural standpoint, and this which might, in certain cases, prove a source of tyranny, has, like all similar regulations, a counterbalancing advantage to the community. In the municipal control of posters and signs we again see the same readiness to defend the citizen on grounds of morality or from the danger of falling signs, but we must still look abroad, except in a few isolated cases, for an official expression of the growing conviction that on artistic grounds, as well as for the good of the general neatness and dignity of the city, there should be restraint on artistic grounds also. In functional matters, in the disposal of sewage, in all matters of construction, there is little need for other than a more exact and logical application of principles already well thought out, but in the employment to advantage of the city's physical opportunities, and in the expression of a municipal pride at all commensurate with the pride which every citizen feels in his own personal domain, we are yet in the early stages of development. How far we have still to go can best be judged by the advance that has already been made at isolated points. Governmental and municipal buildings are being more monumentally handled. They are being protected in some measure from private encroachment. Water supply systems have in more than one instance given handsome buildings, and in at least one case ornamental reservoir lakes.

In municipal pageantry our cities have taken a great step forward in the last 10 years. The various local celebrations that took place at the close of the Spanish war are an example in point, and while we have not yet the extensive paraphernalia such as belongs to almost every considerable city on the other side of the ocean, our cities at least own the nucleus of a collection of civic ornaments for use on occasions of public festivity. Hygiene, on the other hand, has been a powerful appeal. Our regard for it has opened up breathing spots like that at Mulberry Bend in New York, and it is natural that moral and ethical grounds should have taken precedence over the æsthetic.

The history of the modern movement as a conscious scientific effort begins with the work of Louis Napoleon and George Eugene Haussmann in Paris, who, a year after the proclamation of the second empire, decided on the first great and comprehensive scheme of modern city-making. In the following years a scheme of urban development was carried out in Paris which still remains an unsurpassed object les-

## CITY-MAKING

son. Under Haussmann's administration the movement achieved remarkable results, and being in a position to assume title to the improved areas, the increase in values was in large measure preserved to the community and a clear demonstration was made of the fact that such gigantic civic improvements, far from being costly luxuries, could be made paying investments. As prefect of the Seine he transformed a congested and unorganized centre into the most splendid capital of modern times and created a new profession in which his name yet remains the most eminently distinguished.

It was not until many years after that the Germans began to consider the symmetrical development of cities along equally broad lines, though once their attention was turned to the subject, with customary thoroughness they developed a system entirely their own, so that now nearly every German city of over 25,000 inhabitants has a department in its municipal government devoted to city expansion where all problems of extension and improvement are regulated.

George E. Hooker writes on this subject as follows: "Indeed, the great widening of municipal action in the cities of the fatherland respecting education, recreation, charity, hygiene, and 'municipal trading' is less significant than the attempt to give proper shape, both for economic and æsthetic ends, to the entire physical organization of those cities. The authorities have set up the ideal of a city which, in arrangement and structure, should be a rational unity; and while the results achieved have naturally been limited, they are in many respects surprising.

"Hamburg, for example, could displace 30,000 people in order to obtain a proper location for new docks. Nuremberg, while developing into a modern industrial town, has studiously perpetuated its delightful architectural spirit, and any German city which should to-day lay out or permit to be laid out, a new quarter on the easy and wearisome checkerboard plan would be laughed at. There have actually developed in Germany—and in Austria, too—especially during the last dozen years, the rudiments of a real science of city-building, with a limited but distinctive literature of its own."

The appearance of Dr. Albert Shaw's books on municipal government in 1895 gave a distinct impetus to the municipal improvement movement in this country. His painstaking accounts of organic development in many foreign cities and the methods by which they were brought about, created widespread interest, starting a wave of popular enthusiasm and activity, which is evinced by the numerous associations with large and influential membership to be found in almost all progressive centres in the United States.

Among the pioneers in the work was the elder Olmsted, who did much to reclaim numbers of bare spots in American cities and might be considered the father of American parks, although he never carried his work so far as did one of his disciples, the late Charles Eliot. It was Mr. Eliot who blazed the way toward metropolitan development by utilizing the barren and squalid outer zones about Boston for a regular chain of parks, and actually, before his untimely death, establishing in and about Boston the most comprehensive system of public

reservations that any city can boast of, including the redeeming of nearly all water fronts both inland and along the sea. Indeed, the extent of the advantages of these reservations to future generations is not to be estimated, as they ensure a certain amount of openness and verdure for all time, notwithstanding the greatest possible increase in population. Boston, thanks to his foresight, is far ahead of any other municipality in the United States in matters of public recreation and health, and has that which no foreign city can rival. Her water supply, including that of over a score of contiguous communities, is protected from pollution by including the entire eastern watershed of Massachusetts, and for the first time reservoirs have been made to do double duty by becoming ornamental lakes, and as such, spots of much interest in the metropolitan system.

The Boston metropolitan park system was not brought about without much agitation, and to Mr. Sylvester Baxter must be attributed much of the success of the undertaking. His far-sighted articles appeared with great regularity and did much to mold public opinion in favor of the undertaking, and as secretary of the first metropolitan park board, he was able to still further assist in the work.

Since that awakening other writers have come to the front, and prominent among them are the names of Mr. Charles Mulford Robinson and Prof. Charles Zueblin. The former's book, 'The Improvement of Towns and Cities,' is a hand-book which has been endorsed by many improvement societies and which, owing to its concise and business-like presentation, is just what is needed by those interested in the development of backward communities. 'American Municipal Progress' by Prof. Zueblin, goes rather into the sociological side and outlines with surprising interest what an awakening has taken place in the United States during recent years, and what unexpected results this awakening has brought forth along lines of physical development.

Among other of the forces that must be recognized as responsible for the force of the movement are the American League for Civic Improvement and the American Park and Outdoor Art Association. The latter is the older, and through the indefatigable efforts of Mr. Warren H. Manning, the landscape architect, it is well established, and by bringing park superintendents together from many cities it has become a real force and has extended its work beyond the province suggested by its title.

The American League for Civic Improvement, not being restricted either in name or endeavor to a group of professional workers, has carried on a broader campaign and through many local organizations all over the country is doing good work.

The first great object lesson of symmetrical development was exemplified by the Chicago Exhibition, where a comprehensive plan was prepared and adhered to. The height of all main cornices was established at an equal level and certain uniform rules applied to the development of the grounds, the buildings and all architectural accessories. Since then more or less successful efforts along similar lines have helped to educate the public at Omaha, Charlestown, Buffalo, and St. Louis.

The Omaha, Charlestown, and Buffalo exhi-

THE SCIENCE OF CITIES  
 TREATMENT OF A NAVIGABLE RIVER  
 THROUGH AN INLAND CITY

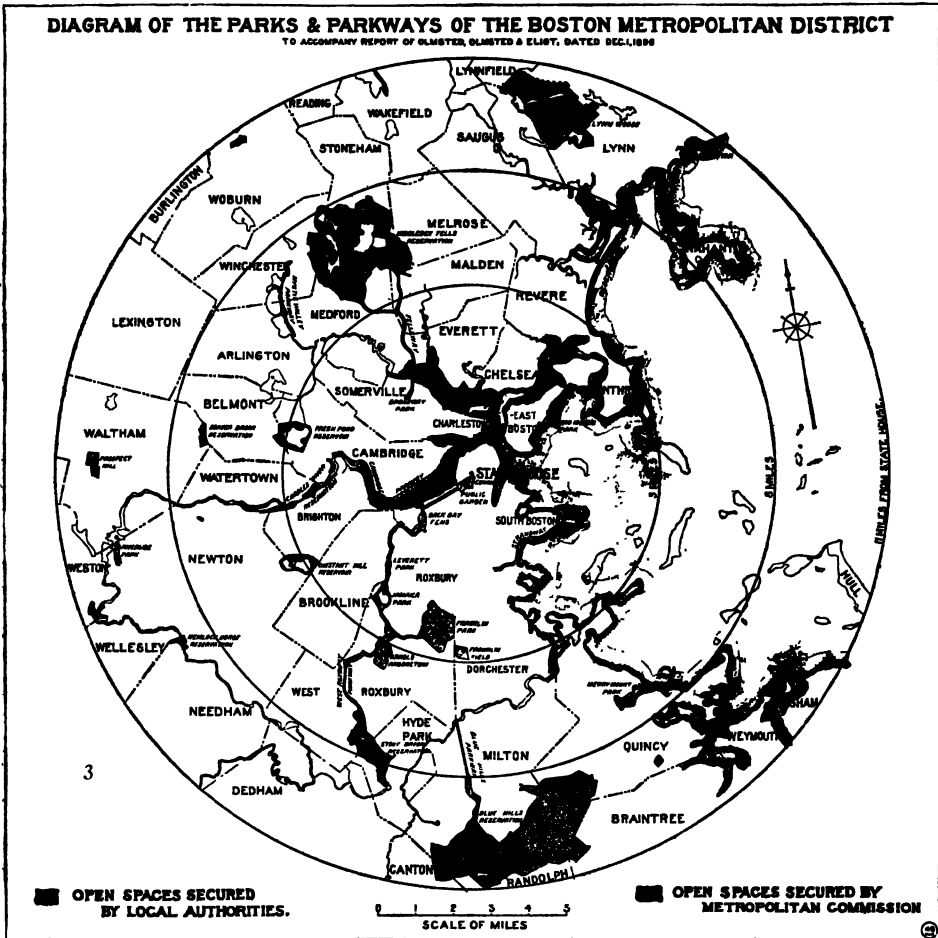

## CITY-MAKING

bitions, and particularly the Louisiana Purchase Exposition at St. Louis, with its Municipal Improvement Section, popularly known as the "Model City," the first of its sort to be held in America, have swelled the current. This latter exhibit, under the direction of the writer, brought together results that had proven the nucleus of interest in municipal subjects at the Paris Exposition of 1900 and the Exposition by Municipalities at Dresden in 1903, as well as the exhibits from the United States.

Nevertheless, the recognition of the need for immediate and radical work toward civic betterment finds the nation better provided with

permitted to run the streets at large, and this fact alone hints at others which are not creditable to the sense of civic pride in these communities. It is interesting to note, however, that almost every educational institution has recognized the importance of the movement, and that municipal governments have also been forced to take note of its growth by the extension of those bureaus of administration, the work of which relates to the care and development of the civic domain, and by the appointment of additional officers, such as city architects, foresters, etc., in addition to the engineering force. Moreover, Boston has added a

true-hearted soldiers, anxious to work in the ranks, than with enough good leaders to point the way toward the much-coveted ideal, or even any steps toward it. In a recent article in one of the leading magazines, Mr. J. Horace McFarland gives extracts from letters all over the country, the tenor of which was,—“there is much to do and many who stand ready to do the work, but we need leaders.”

The primitive character of some of the needs proclaimed by the organizers of societies for municipal reform would be amusing, if it did not mirror a state of affairs almost incredible. From several towns we learn that the hogs are

municipal nursery to its civic departments, and thus its verdure has become a matter of as much public concern as the water supply. New York has an architect on bridges, and many park boards now properly insist on having all designs for contemplated improvements prepared by an expert commission, including a landscape architect, an architect, and an engineer.

The plan for the embellishment of the city of Washington, prepared by the Park Board Commission, of which Daniel H. Burnham was chairman and Charles F. McKim, Frederick Law Olmsted, Jr., and Augustus St. Gaudens the other members, is at the present writing the

## CITY-MAKING

best illustration of organic city-making actually under way in the country, though other cities, notably Cleveland with its group plan, are following suit.

Two of our illustrations show this plan for the regeneration of Washington, in which, by means of a number of monumental avenues, a series of vistas will be opened up, each with notable foci, such as large public buildings or monuments, by which the city will be given unity of plan and will outrank most cities in ease of access from part to part, and in the magnificence of its public ways. The chief of these avenues will be the new Mall, and it is only proper to add that this is a return to the ideal of the original designer of the city plan, developed on a more magnificent scale and glorified by memorials and architectural masterpieces that have come as the expression of national growth and history.

Another illustration, Figure 3, shows the work that has been done in the neighborhood of Boston, and may be taken as the type of the highest accomplished result in the development of an extended park system in and about a large municipality. The feature of this plan which distinguishes it from all others is the attention given to the future. By acquiring all water fronts, inland and seashore, Boston is gradually extending its park system and improving its waterways for all time. The city as a unit a hundred years hence is being arranged for. In the meantime a metropolitan system of scattered units is rapidly crystallizing.

Other illustrations exhibit in diagrammatic form the possibility which has at more than one point become an accomplished reality, of governing the character of the natural waterways. A river or any water front, whether now given up exclusively to commerce or whether it shows a broad, unhealthy mud-flat on either side, can be easily redeemed. According to the exigencies of the occasion the treatment must vary, but taking the most demanding conditions, it will be seen that the requirements of traffic by rail and water may be much better met if the problem is comprehensively studied, that the logical arrangement of the various structures is economical in every sense, and gives the opportunity to bring the beauty of shaded drives where formerly the conflict of the various enterprises made only confusion and barrenness. Moreover, the river being now confined within vertical banks, the current scours its own bed and the railway and canal are, moreover, protected from inundation. Thus, natural force and inventive planning combine to improve the salubrity, beauty, and revenue yielding power of an area in which private and public interests being at conflict have lost all trace of the beauty that once belonged to them, and which could again be theirs by conciliation of purposes and the expressed sense of interdependence between the various needs of society.

Figs. 5 and 6 are a project for the grouping together of public conveniences, a problem of the utmost importance in the congested portions of cities. In this drawing an attempt has been made to show how, instead of a number of scattered and unsightly units which have no excuse but their utility, the same ends may be efficiently served, while adding to the city a focal point of beauty.

Moreover, such centres, no matter what

form their superstructure may take, should be points from which to thread pipes and wires radiating in all directions, and thus making unnecessary the greater part of the outrageous tearing up of streets, now of so frequent occurrence. Here again can be laid stress on the principal aim of municipal science, which is to replace the haphazard and accidental arrangement of cities with its incalculable waste of time, money, comfort, and beauty by a logical system and arrangement by which the needs can be at least as well met for a city as they now are for even the most complex of single buildings, and in which the various public and semi-public buildings can be so grouped with mutual economy. The transportation facilities of our cities are inadequate and yet wasteful of space, and without due regard to the convenience of the public; yet at no greater cost, by well considered arrangement at the outset, a system of stations and subways could lead to terminal facilities of sufficient capacity and in more direct relation to the requirements of business.

In this connection are to be mentioned the terminal warehouses in St. Louis, where a private company has united the depots of many independent railroads, thus forming a great freight centre, which has proven an isolated but striking lesson in economy. At Algiers, in North Africa, a similar combination exists between the steamship companies and the railroads. The dryness of the climate has here made it possible to use for this purpose huge vaults, above which passes the magnificent Boulevard de la Republic, a combination of utility, economy, and beauty, which should prove a spur to nations which pride themselves on their superiority in other matters.

Mankind has been so long accustomed to the economy gained by uniting for common ends that it seems more remarkable that the question of location, in its relation to the functions assumed by society, has not been more carefully studied. We have municipal hospitals, theatres, libraries, school houses, public baths, and gymnasias, and recreation grounds, from the sand-courts for the smallest children to the ball parks for men, but instead of being made centres of improvement which, as functional centres they should normally be, they are too often ill placed and inadequately arranged.

With regard to school houses this is especially true. There these buildings, so essential to our democratic system, have been erected with regard to an outward appearance befitting their functional character, and have been given that amount of yard space per child which should be made an invariable requirement, as it now is in some places; they have become the centres of local pride and local improvement, and have raised the value of neighboring properties and gone far to reduce local jealousies caused by the placing of those large public works which, unlike school houses, are not the necessity of every ward.

Resolved to its final analysis, the science of city-making appears under the heads of circulation, hygiene, and beauty, and concerns itself with the uniting of these three problems in a scheme of urban life and development in which they shall be fused in a perfection of interdependent and co-related response to the universal needs of man. The conditions of the age, the

## CITY GOVERNMENT — CIUDAD JUAREZ

climate and the location, if rightly interpreted, will give it the expression of a perfect and model city in the terms of the given land and people.

ALBERT KELSEY,  
*Civic Architect.*

**City Government.** See MUNICIPAL GOVERNMENT.

**City Point,** a village in Prince George County, Va., 10 miles northeast of Petersburg; on the James River and on the Norfolk & W. R.R. It has a trade in brick, lumber, and phosphates, and is of considerable historical interest. Here, in 1864, Gen. Grant made his headquarters, and in his subsequent operations the city was used by the Federal army as its principal landing-place and depot for supplies. Pop. about 1,000.

**City Politiques,** pōl'i-tēks', a satirical comedy, probably printed for the first time in 1683, and produced at the King's Theatre, London, the same year. It was a sharp attack on the contemporary Whig faction, especially on Oates. Only the king's protection kept it from being suppressed by the victims of the satire.

**City of Brotherly Love** (Gr. *φιλὰδελφία*, *philadelphia*, *φίλος* *philos*, dear, and *ἀδελφός*, *adelphos*, brother). William Penn gave the English rendering of the two words as the name, Philadelphia, to the city in Pennsylvania. The common rendering into English of the name of the city is "City of Brotherly Love."

**City of Churches,** a name given to Brooklyn, N. Y., because of the large number of churches in proportion to the population.

**City of David,** Bethlehem (modern Beit-Lahm, house of bread), supposed to be the birth-place of David, the place where his descendants had to go for the enrollment, when the census was taken by order of the Roman emperor. Jerusalem is sometimes called the "City of David" because he captured it from the Jebusites and made it the capital of his kingdom.

**City of Destruction, The.** In Bunyan's 'Pilgrim's Progress' Christian begins his journey at this city and journeys to the Celestial City. The place of beginning represents the world with its temptations, and the place of ending, Heaven with its joys.

**City of Dreadful Night, The,** a poem by James Thompson. In this poem one is supposed to have gone to a city whose inhabitants are gloomy, hopeless, despairing. The hopeless darkness is as the night — oppressive and dreadful.

**City of Elms.** The large and ancient elm trees which adorn the Green and many of the older streets of New Haven, Conn., have caused this city to be called "City of the Elms."

**City of God, The,** a noted work by St. Augustine. This, the most important of all the saint's writings, was begun in 413, three years after the capture and pillage of Rome by the Visigoths under Alaric. The pagans had endeavored to show that this calamity was the natural consequence of the spread of the Christian religion, and the main purpose of Augustine is to refute them. The work was finished about 426.

**City of Homes,** a name bestowed on Philadelphia, from the large number of dwellings inhabited by the owners.

**City of a Hundred Towers,** a name given to Pavia, Italy, from the many towers and steeples which first greet the traveler.

**City of Magnificent Distances, The,** a name given to Washington, D. C. When the city was planned, the last of the 18th century, the long and broad streets, with here and there small parks, almost all of which was out long distances in broad fields, caused this name to be given to it in derision. Now its citizens are proud of the title.

**City of Oaks,** a name given to Raleigh, N. C., from the size and beauty of some of the oak trees which adorn its streets.

**City of Palaces,** a name applied to Calcutta, India, from the numerous palace-like edifices.

**City of the Plague, The,** the name of a poem written by John Wilson (Christopher North), published in 1816. It is said to have been founded on the 'Journal of the Plague in London,' by Defoe.

**City of the Prophet,** a name given to Medina, in Hedjaz, Arabia; the second holy city of the Mohammedans; the place where Mohammed took refuge, in 622, when he fled from Mecca, and the city where he died.

**City of the Straits,** often applied to Detroit, Mich., from its position. It is situated on that part of Detroit River between Lake St. Clair and Lake Erie.

**City of the Sun,** a name given to Baalbec, an ancient city of Syria, built on the ruins of the Greek city, Heliopolis, "The Sun City."

**City of the Violet Crown, The,** a name applied to Athens.

**City of Victory,** a translation of the Arabic name for Cairo, the capital of Egypt.

**City Water Supply.** See WATER SUPPLY OF CITIES.

**Ciudad,** thē-oo-dād' or sē-oo-dād', in geography, the Spanish word for city, from the Latin *civitas*, appears in many names of Spanish places, as Ciudad-Rodrigo, Ciudad-Real, etc.

**Ciudad,** thē-oo-dād' or sē-oo-dād', in Venezuela, capital of the state of Bolivar, on the Orinoco. Although about 245 miles from the mouth of the Orinoco, it is one of the chief ports of Venezuela. The handsome dwellings, beautiful cathedral, theatre, monuments, and plazas make it a pleasant city. Its chief exports are sugar, coffee, rubber, cattle, hides, asphalt, and cabinet woods. The city was founded in 1764 and was called Angostura. The name was changed in 1819 to its present one in honor of Simon Bolivar. Pop. 12,000.

**Ciudad De Cura,** dā koo'rā, or Cura, Venezuela, in the state of Guzman Blanco, southwest of the city of Caracas, about 20 miles east of Lake Valencia. It is a 17th century city, but many of its new buildings are modern in style and beautiful in architecture. The streets are broad, many small parks adorn the city, and the inhabitants are justly proud of their library. Pop. 12,200.

**Ciudad Juarez,** hoo-ä'reth (formerly EL PASO DEL NORTE), Mexico, state of Chihuahua. It is on the Rio Grande River, opposite El Paso,

## CIUDAD PORFIRIO DIAZ — CIVIC CROWN

Texas, on the Mexican Central R.R., about 210 miles north of Chihuahua, the capital of the state. Altitude about 3,800 feet, country around fertile and producing fruit, grains, and vegetables. Cattle are shipped to various parts of the United States. It has a Mexican custom-house and an army post. A United States consul is stationed here. Pop. 7,200.

**Ciudad Porfirio Diaz**, pôr-fé'rē ō dē'āth, Mexico, town in the state of Coahuila, on the Rio Grande, opposite Eagle Pass, Texas, on the Mexican International R.R., and is the Mexican terminal of the international bridge across the Rio Grande. It has a custom-house, army post, large cattle markets, and but poor buildings for the storage of fruits or grains. It is situated in an agricultural region, and its trade with the United States consists chiefly in exporting grains, fruit and cattle, and in importing manufactured articles. Coal beds near are of value and may cause the establishing of manufacturing. It was founded in 1849. Pop. 5,200.

**Ciudad Real**, thē-oo-dād' rā-āl', the name of a province of Spain, occupying the south extremity of New Castile, and of its capital. The area of the province is 7,620 square miles. The surface in general is bare-looking, immense plains stretching from the mountains of Toledo to the Sierra Morena. The mountains of Ciudad Real abound in minerals: iron, silver, copper, lead, antimony, cinnabar, and coal; also in quarries of marble, jasper, quartzite, granite, etc. Medicinal and mineral springs, both hot and cold, are abundant. The climate is dry, and in the heat of summer very oppressive. The plains and valleys are productive in the vicinity of the rivers; in favorable seasons good crops of cereals are obtained. Cattle, sheep, mules, etc., are reared. Woolen, linen, and other fabrics, hardware, earthenware, esparto, etc., are manufactured; brandy, wine, and oil of good quality are made. Metals, manufactured goods, brandy, wine, and oil, horses, mules, and cattle are exported. The city of Ciudad Real is situated on a low plain near the Guadiana, 100 miles south of Madrid. The walls are in many parts ruinous. The principal edifices are the Church of Santa Maria del Prado, consisting only of a single nave, but so grand and lofty that no other in Spain, except the cathedral of Coria, equals it; the hospital; the institute, with a good laboratory and botanic garden. The manufactures and the trade are of little importance — the former in woolen and linen cloths, the latter in grain, wheat, wine, etc. Pop. about 15,000. Pop. of the province (1900) 321,580.

**Ciudad Rodrigo**, rōd-rē'gō, Spain, a fortified town in Leon, on the river Agueda, about 55 miles south-southwest of Salamanca. There is a castle dating from the 13th century. The cathedral was begun in 1100 and contains many interesting features. Ciudad Rodrigo was a place of considerable importance in early Spanish history as a frontier fortress. It was taken by the English in 1706 during the war of the Spanish Succession, and recovered by the Spaniards in 1707. The fort was surrendered to the French under Masséna, 10 July 1810, having been bombarded 25 days; and 19 Jan. 1812, it was taken by storm by the British under Wellington, after a siege of 11 days. The Cortes bestowed upon Wellington the title of Duke of Ciudad Rodrigo. Pop. 8,000.

**Ciudad Victoria**, sē-oo-dād' vīk-tō'rē-ā, Mexico, capital of the state of Tamaulipas, on the main line of railroad which runs from Tampico to Monterey, about 100 miles from the Gulf coast. It is in a sugar and fruit-growing region, but the sugar only is exported. It is an episcopal see and the residence of a consular agent of the United States. The city was founded in about 1750. Pop. 14,800.

**Ciudadela**, thē-oo-dā-dā'la, Spain, a city and seaport on the island of Minorca, at the west side. It is surrounded by walls and a ditch, and has a cathedral, municipal buildings, hospital, cemetery, and several convents. The inhabitants are engaged in weaving woolen fabrics, expressing oil and wine, and in husbandry. Pop. 8,447.

**Civets**, a family of small carnivorous mammals, the *Viverridae*, related to both the hyenas and the cats. Their alliance to the former appears when the fossil history of the family is traced back to the early Tertiary, where the ancestry of both converges. The comparatively coarse hair, erectile mane, possessed by some species, and dentition, are still hyena-like; while the slender, elongated form, long tail, and especially the fact that the claws are semi-retractile, exhibit the inborn likeness to the cats. The civets vary from two to three feet in length, and most of the species are strongly marked in black and white stripes and spots, sometimes prettily disposed. They are distributed throughout the warmer parts of the Old World, abounding in Africa and the Malayan Islands, but are absent from the Australian region. The family is divisible into two groups, one of which includes the typical civets; the African genet (*q.v.*), one species of which also inhabits Spain and Italy; the linsangs and other Oriental spotted forms, and the paradoxures. The second group includes the mungoes and other ichneumonians, suricates, and the like. These various forms will be found described elsewhere under their separate names.

Civets feed upon smaller mammals, birds' eggs, lizards, and snakes, and are considered beneficial because of their appetite for crocodile eggs, which they devour in great quantities along the Nile. They are characterized by, and chiefly valued for, an odorous, fatty substance, contained in a pouch connected with the sexual organs, in both sexes. This substance is used for compounding perfumes, and is ready for use after it has been drained, washed and dried. It is called "civet." A dram is obtained at a time from each animal, from which it is taken at intervals of a few days. Many thousand ounces are annually imported into London. Pure civet is valued at about \$10 an ounce. The American "civet-cat" is the *cacomistle* (*q.v.*), which is not a true civet, but nearly related to the raccoons.

**Civic Crown**, among the Romans, the highest military reward assigned to him who had preserved the life of a citizen in battle. It bore the inscription *Qb civem servatum*, that is, "for saving a citizen," and was made of oak leaves. He who was rescued offered it, at the command of his leader, to his preserver, whom he was bound to honor afterward as a father. Under the emperors it was bestowed only by them. The person who received the crown wore it in the theatre, and sat next the senators.

## CIVICS—CIVIL LAW

When he came in all the assembly rose up as a mark of respect. The senate granted to Augustus, as a particular mark of honor, that a civic crown should be placed on the pediment of his house, between two wreaths of laurel, as a sign that he was the constant preserver of his fellow-citizens and the conqueror of his enemies. Similar honors were also granted to the Emperor Claudius.

**Civics**, the science which deals with the theoretical and practical aspects of citizenship; the duties of citizens to each other as fellow members of a body politic, and to the government. In its broadest aspects it includes civil law, political economy, and finance, as well as social ethics, governmental methods, and the history of social and political development; but the first three are counted as separate sciences from their extent and specialty, and civics proper is concerned with the last three. This is becoming a recognized study in the schools and colleges of the United States.

**Cividale**, chē-ve-da'la, Italy (the ancient *FORUM JULII*), a town of Venetia, in a basin of the Julian Alps, eight miles east-northeast of Udine. It consists of the town proper, surrounded by walls and ditches, and of fine suburbs; and has among its edifices a large cathedral of the 15th century, with three Gothic portals, a curious baptismal font, and several fine paintings; a museum of antiquities, and a record office with some very ancient charters. The neighborhood abounds in interesting antiquities. Pop. about 9,000.

**Civil Action**, an action brought in the civil courts for the recovery or protection of private or civil rights, or damages for their breach. The two great classes into which actions are divided are civil and criminal. In civil actions either a government or a private individual may be plaintiff or defendant; while criminal actions are always brought in the name of the government.

**Civil Damage Acts**, legislative acts passed in several of the States, giving to husbands, wives, children, parents, guardians, employers, and others who have sustained injury in person or property or means of support, by an intoxicated person in consequence of such intoxication, the right of action against the person who sold or gave away the liquor which caused such intoxication. Such acts have been held to be constitutional. In some cases the right of action has been extended to the owner of the premises where such intoxicating liquor has been obtained.

**Civil Death** is where a person, although possessing natural life, is on account of some crime for which he has been convicted, sentenced to life imprisonment, and thereby lost all his civil right, is considered in law, dead. In some jurisdictions a person convicted of murder and sentenced to life imprisonment is considered in law as dead.

**Civil Engineering.** See **ENGINEERING, CIVIL.**

**Civil Law, The.** 1. *Introduction.*—The term Civil Law (*Jus Civile*) is commonly and popularly used in several distinct senses. Thus we distinguish it on the one hand from the *Jus Gentium* and on the other hand from the *Jus Naturale*. Again our municipal law is called the civil law, and further we distinguish between

civil and criminal law on the one hand and civil and canon law on the other. But it is here used as referring to the whole body of Roman law (the *Corpus Juris Civilis*), having its proper origin contemporaneously with the genesis of the Roman state, and coming down in ordinary generation, from century to century, through the regal period, the republic, and the empire to the codification of Justinian and Napoleon.

When we speak thus of the Civil Law we mean the whole system of usages and rules of private law adopted by the Roman people; their *jus privatum* as opposed to their *jus publicum* (including criminal and sacred law). The *Corpus Juris Civilis* as left by Justinian was the result of a gradual modification and enlargement of the code of the XII Tables under three great influences—the Jurisconsults, the Prætors, and Legislation. The institutional definition of the *jus civile* as the peculiar law of Rome, in contrast with the *jus naturale* and the *jus gentium* is a mere philosophical flourish; by late writers *jus civile* was confined to the *responsa prudentium* alone; what the Roman jurists had chiefly before their mind when they used the expression was the old law of the XII Tables, as contrasted generally with the newer development of the *jus honorarium* (Hunter, *Roman Law*, 24).

Thus the Roman law presents two aspects, each perhaps equally deserving the attention of the student of jurisprudence. From one point of view it furnishes the sound and scientific basis of the greater part of the modern law of all civilized mankind, and has long proved an inexhaustible storehouse of legal principles. On the other hand, it forms a connecting link between the institutions of our Aryan ancestors and the complex organizations of modern society. In its ancient records it takes us back to the very inception of civil jurisdiction, and tracing it down for more than 2,500 years from the Rome of Romulus and Servius Tullius, we see it constitute a legal development not matched in the history of the law of any other people. The oldest fragments of the Roman law that have come down to us are ascribed to the period of the kings, but these are essentially traditional and practically insignificant, and we take the XII Tables as the first solid ground in the history of the Civil Law.

2. *The Law of the XII Tables.*—About the year 450 B.C. a commission from Rome visited Greece for the purpose of collecting information necessary to draw up a written code of laws. This fact suggests a foreign or Greek extraction for at least a part of the oldest body of Roman law, although it must of course be conceded that the XII Tables undoubtedly contained much law of indigenous growth. Three centuries had intervened between the founding of the city and the promulgation of the law of the XII Tables. During this period a certain body of local, customary law had inevitably developed, some part of which must have been incorporated into this first written code. Until the time of Diocletian (245-313 A.D.) professional lawyers, strictly so called, were not known in Rome. The business of practising law, so to speak, had been up to that time regarded as a public office, which each citizen might be called upon to undertake; but about that time there began to grow up in Rome a class of men among the patricians who made it their busi-

## CIVIL LAW

ness to know the law. Pomponius in his history of the Roman law, written about the middle of the 2d century A.D., informs us that the custody of the XII Tables, the exclusive knowledge of the forms of procedure and the right of interpreting the law belonged originally to the College of Pontiffs, a patrician order, at the head of which was an officer known as the Pontifex Maximus, from which office it may be remarked in passing, indirectly and by a strange and circuitous devolution has come down to our day the office of the Pope in the Roman Catholic Church. Only a small part of the language of the substantive law of the XII Tables has been transmitted to our time. Some learned attempts have been made to patch out the substance of each table, but it is by no means certain that the exact fragments of any part of the XII Tables have come down to us in their precise original form and expression. The language has probably been essentially modified by the subsequent Latin usage and by repeated transcription; and the fragments have had to be picked out and pieced together from numerous references in the later literature, as for example from Cicero, Dionysius and Gaius; so that, as matter of fact, what passes for the substance of the XII Tables is probably largely a speculative patch-work, and in its content and significance certainly more or less misleading.

3. *The Jurisconsults and the Prætors.*—The Jurisconsults, a professional class of jurists or legal writers dating from the century before Christ, were given by Augustus an authority and standing which they had not theretofore possessed, and from his time much weight is to be attached to the opinions and writings of the more eminent of them. In 426 A.D. Valentinian enacted a law, commonly called "the Law of Citation," providing that the writings of only five jurists,—Papinian, Paul, Gaius, Ulpian, and Modestinus, should be quoted as authorities. If a majority of these held one opinion, that was to bind the judge; if they were equally divided, the opinion of Papinian was to be adopted. The great bulk of Roman law as it has come down to us, and all that is most valuable in it, is due to the jurisconsults. The Prætor stood in Roman law midway between the jurisconsults and the legislature. At first there was but a single Prætor, but later a Prætor-Urbanus and a Prætor-Peregrinus (when the empire extended beyond Italy, the number being increased to 18), dividing the jurisdiction among them generally either along the line suggested by their names, or territorially. The Prætor exercised a qualified or limited legislative power. His right to alter the law was conceded, but it was not unlimited. He was in some sort the Chancellor, the keeper of the conscience of the Roman people, or the person who was to determine in what cases the strict law was to give way to natural justice (*naturalis æquitas*).

4. *Legislation.*—To give an adequate account of Roman legislation would be to write the constitutional history of Rome, something quite beside the purpose of this article. It is important, however, to state that during the republic the popular assembly was the foundation of legislation. During the earlier part of the empire the function of the popular assembly was gradually usurped by the Senate, acting more and more as the mere mouth-piece of the emperor. Finally even this form was dropped, and

all enactments were made directly by the emperor. During the republic three assemblies of the Roman people existed,—the *Comitia Curiata*, a patrician body, the *Comitia Centuriata*, composed both of plebeians and patricians—the franchise being on the basis of a property qualification—and the *Comitia Tributa*, which was based on a local division of the people of the city—the vote being given territorially, as if by arrondissements, cantons, or wards. The sovereign power was exercised by the emperors in three ways.—(1) by direct legislation (*edicta, constitutiones*); (2) by judgments in their capacity as supreme judge (*decreta*); and (3) by *epistolæ* or *rescripta*, giving instruction on questions of law in answer to applications from the judges.

5. *Codification.*—The earliest collection of law in Rome was the *Jus Papirianum* of the regal period (*temp.* Tarquinius Superbus), and it was not until 304 B.C. that the full knowledge of the law was wrested from the patricians. The constitutions of the emperors were collected at different times and constituted the first codes. The oldest collection in the form of a code is the *Codex Gregorianus et Hermogenianus*, which covers a period of 200 years from Hadrian to Constantine. Only fragments of it remain. Next we have the *Codex Theodosianus*, made about the year 435 A.D. The Theodosian Code has small pretensions to scientific classification, but it runs to 16 books and has come down to us almost complete. The reign of Justinian (527-565 A.D.) marks the culminating period of Roman law. In collaboration with Tribonian, he prepared, or caused to be prepared, a complete codification of the whole body of the law, first appointing a commission of 10 members to draw up a Code along the general lines of the Theodosian Code. This is called the *Codex Iustus*, which was speedily superseded by a later edition and has been entirely lost. Next, about the year 530 A.D., Justinian created a commission of 16 members to collaborate with Tribonian in a codification of the vast accumulation of law that had grown up under the hands of the Jurisconsults and the Prætors. The commission had to deal with the works of 39 jurists, consisting of 2,000 books and 3,000,000 verses. This matter was finally sifted and reduced to 50 divisions or books, and constitutes what we know as the Digest and the Pandects. For the purpose of providing an elementary or preparatory text-book of the law, a commission was further constituted by Justinian, which prepared the Institutes of Justinian, which are in some sort a little more than a revision or a new edition of the Institutes of Gaius. After publishing the Pandects and the Institutes in 534 A.D., a commission was appointed to revise the old code and to incorporate the new constitutions and decisions. This revision was completed in the same year, and promulgated on 16 Nov. 534 A.D. Laws of a permanent character, subsequent to Justinian's codification, were collected from time to time and called Novels.

6. *The Justinian Law in the West.*—Upon the fall of the Western Empire and the subsequent local disorder and social disintegration throughout western Europe, the civil law fell into disuse in the West, and during the Middle Age was largely lost sight of; but in the 12th century the study of the Civil Law was revived at Bologna and spread thence throughout Italy.

and into France. In 1453, about nine centuries after Justinian, Constantinople was taken by the Turks and the Eastern Empire was overthrown. During some five centuries, or more than half of the existence of the Eastern Empire after Justinian, the law nominally remained as settled by Justinian's legislation, modified indeed by subsequent novels of the emperors; but about the end of the 11th century the Justinian Code fell into abeyance without special abrogation. The great causes of its decay were the change of language from Latin to Greek, the accumulation of fresh law and of commentaries, the authorized readjusting of the whole by several of the later emperors, and the overpowering influence of the ecclesiastical or the canon law. The revival of the study of Roman law and the rise of the Bologna school, were formerly erroneously attributed to the alleged discovery of a manuscript of the Pandects at the sack of Amalfi by the Pisans in 1137; but it has recently transpired that the study of the Roman law had begun to be pursued with ardor at Bologna and elsewhere in Italy long before that time. However, the manuscript in question, now called the *Pandectæ Florentina*, taken to Florence on the conquest of Pisa in 1406, is well known; it is a very ancient and valuable copy of the entire Pandects, being also the only one in existence that dates before the age of the Glossators. The fame of the school at Bologna spread throughout Europe, attracting crowds of students from all quarters and reviving a vivid interest in the Civil Law.

About 1135, or a little earlier, the code of Justinian was translated into French, and by the 13th century many French translations had been made of the Digest, the Institutes, and the Code. By the 12th century ecclesiastical councils had begun to forbid ecclesiastics to study the secular law (Rheims, 1131; the Lateran, 1139; Tours, 1162). This ecclesiastical inhibition served somewhat to check the study of the Civil Law at Paris—then as now the chief university town of Europe—and was favorable to the continued predominance of Bologna as the seat and centre of civil law study, to the growth of the Montpellier School, and to the establishment of new schools, the chief of which were at Toulouse and at Orleans. All these great schools in France—except Paris—and the numerous schools that sprung up in the succeeding centuries, taught the Civil Law on the basis of the Justinian text. After the spread of the scientific study of Justinian's works from Bologna to Montpellier and other parts of France, the Justinian law in the 12th and 13th centuries gradually replaced the ante-Justinian, as being the more perfect form of the Roman law. In 1250 France was still divided under two laws; in the south (*pays de droit écrit*) the Roman law obtained, modified by local customs; in the north (*pays de coutume*) local customs prevailed, slightly modified by Roman law, which, however, was taught in the northern schools and left numerous traces in the legal works of the period. A Dutch school of jurists arose toward the end of the 16th century at the University of Leyden. So, too, in Germany some progress was made in the study of the Justinian law. Like the jurists of other countries, those of Germany were impressed by the superiority of the Roman law to their native law, both in form and substance, and their

admiration induced them by degrees to put it forward in practice. The influence of the Bologna revival extended into Spain, where a crude codification was effected as early as 1263, called *Siete Partidas*, but not generally adopted throughout the kingdom until about the reign of Alonzo XI. in 1348. The Roman law worked its way into Scotland by way of France. From the close alliance that so long subsisted with France, Scotland, besides borrowing many of its institutions from that country, also "imported a large portion of Roman jurisprudence to make up the deficiencies of a municipal law, long crude and imperfect, and which had made little progress as a national system till some time after the establishment of the Court of Session in 1532 by James V., after the model of the Parliament of Paris. . . . Properly speaking, the teaching of the civil law commenced in Scotland at the Reformation in 1560"; after which date, as well as before it, the more ambitious students of the civil law also availed themselves of the best professional teaching of the continental universities. "In Scotland a knowledge of the Roman law has always been regarded as the best introduction to the study of the municipal law. . . . All the best writers on the law of Scotland, such as Stair, Bankton, Erskine, and Bell, were able civilians; and though they have not produced separate treatises on the subject, their works abound with admirable illustrations of the Roman law, evincing great learning and research, and a familiar acquaintance with the writings of the continental jurists." (Mackenzie, *Studies in Roman Law*, 40-1).

The influence of Roman law on the English common law has been very differently estimated by different writers. Mr. Stubbs stands at one pole of the controversy with his eyes shut, saying, "England has inherited no portion of the Roman legislation except in the form of scientific or professional axioms, introduced at a late period, and through the ecclesiastical or scholastic or international university studies. Her common law is, to a far greater extent than is commonly recognized, based on usages anterior to the influx of frudality,—that is on strictly primitive custom." (Stubbs *Const. Hist. of England*, I., 10 § 8.) This is perfectly insular and manifestly untrue. The other and sounder view as here taken is presented in Reeves' 'History of the English Law,' following Guizot and Mackintosh, and more recently an equally enlightened view has been taken by Pollock & Maitland in their 'History of English Law.' The definite traces of Roman law surviving the Roman domination of the island are exceedingly slight. Selden states that the Roman law wholly disappeared in England until it was re-introduced from Bologna in the 12th century. A little before the middle of the 12th century, Vacarius, a Lombard, went over to England with Archbishop Theobald and lectured on the Civil Law at Oxford with success. Even Stubbs admits that before the end of the reign of Henry II. the procedure of the Roman civil law had become well known by the English Canonists. Henry of Bracton was the first really scientific commentator on the law of England, and the greater and more important part of his work is little more than a transcript of the Roman law. He shows everywhere close familiarity with the *Corpus*

## CIVIL LAW

*Juris.* The Novels are not quoted, but the Institutes are referred to, and there are many quotations from the Digest and the Code, while a very large number of passages are incorporated bodily into the text itself and into the tissue of the author's commentary without any statement as to their source. From Bracton and Glanvill to Pollock & Maitland, the predominating influence of the Roman law in English jurisprudence is everywhere traceable and evident. "The English system of equity and the ecclesiastical law have been formed more or less extensively on the Roman law or on the Roman through the Canon law." (Mackenzie, 'Studies in Roman Law,' 40.)

Both in England and in Germany the influence of the Roman law was resisted and its predominance looked upon with disfavor, but it nevertheless made its way *pari passu* with advancing civilization in each country, becoming in fact and effect the substantial *corpus juris* of the one country directly and of the other indirectly. Many causes combined to open the way both in Germany and in England for the practical application of Roman law. Among them, especially in England, were the impulse given by the universities and the Oxford School of Civil Law, the recognition of the Roman law in the clerical courts, whose jurisdiction extended over a class of civil matters, and the personal influence of the higher judges, who mostly belonged to the clergy, and were therefore versed in the Roman law. Above all, however, was the necessity of supplying the defects of the common law, which had become manifest from the growth of trade, the increase of intercourse, and the greater importance of movable property; for the common law had expended its best energies in the completion of the legal constitution of the feudal system, and had showed no tendency toward creating an original commercial law. To these causes must also be added the scientific superiority of the foreign law with its completeness, over the domestic law with its want of theoretical development. Even at an earlier period it is not improbable that the Roman law had been used as an assistant and complementary authority in the Curia Regis, upon which court it was incumbent to instruct the inferior judges in regard to the law in doubtful and omitted cases. A legal principle enunciated by that court had authority beyond the particular case in which it was laid down, and became, by means of its actual use, part of the *jus non scriptum, consuetudinarium*. As Roman legal matter obtained reception, although the written sources of the Roman law were not at all received as having a legislative authority, Bracton properly included the former among the *leges et consuetudines Angliæ*. (Prof. Dr. Güterbock, *Henricus de Bracton*, etc., translated by Brinton Cox, 60-2).

7. *Code Napoleon.*—Some steps were taken during the reign of Louis XIV. looking to a codification of the French law. Little, however, was accomplished, and the French people owe to the constructive genius of Napoleon the present scheme of codification, which was undertaken during the consulate at his dictation, and finally completed, one code at a time, shortly after the end of his reign. The Civil Code, which was the first, was enacted and became the law of the land 21 March 1804. It was prepared by a council of jurists assigned by the First

Consul to the work; but he himself took great personal interest in it, attending many of the sessions of the Commission and contributing much by his acute suggestions to the form and content of the law. With some fitness he is reported to have said, "I shall go down to posterity with the Code in my hand." This code, called at first the Code Napoleon, but now the Code Civil, has to do with the law of obligations, of persons, of personal status, and of property. It contains 2,281 sections, many of them of only a line or two in length, and is comprised in a volume of less than 350 pages. The whole body of law in France at present, substantive and adjective, civil and criminal, is comprised in eight codes, as follows: *Le Code Civil; Le Code de Procédure Civile; Le Code de Commerce, Le Code Pénal; Le Code d'Instruction Criminelle; Le Code Forestier; Les Codes de Justice Militaire*. The scope and purpose of each of these codes is generally and sufficiently disclosed by its title. This codification is supplemented by the *Lois Usuelles*. The sources of the codified law of France are: (a) the ancient laws of the realm theretofore in force, consisting of local customs (custom of Normandy, custom of Paris, custom of Brittany, etc.); (b) the written or Roman law; (c) such legislative enactments of the National Assembly, the Legislative Assembly, and the Convention, and such of the Decrees of the Consuls and of the Directory, between 17 June 1789 and 15 March 1803, as were thought by the codifiers to be of permanent value; and (d) such general laws as have been enacted since 21 March 1804. The Roman law constitutes the foundation and groundwork of the structure, the other constituent elements indicated being merely subordinate or ancillary.

8. *The Extent of the Civil Law Throughout the World.*—The civil law in its modernized form and substantially as enacted in the Code Napoleon has, within a century past, become the law of more than three quarters of civilized mankind. To be more exact, it is thus the law not only of France and of all her colonies, but also of Italy, Greece, Switzerland, and all the minor countries of southeastern Europe, of Spain and Portugal, Belgium, Holland, and her colonies, of Austria-Hungary, Germany, Norway and Sweden, Denmark, Russia, Mexico, together with all the countries of Central and South America—all of the Western Hemisphere from the Texas border to Cape Horn—of Scotland and the Philippine Islands, the West Indies, and Louisiana, of Egypt, and of all the other civilized parts of Africa, and of a majority of the more important British colonies, to-wit: Quebec, Ceylon, British Guinea and other English possessions in Africa, and Australasia. It is also working its way into Turkey and her dependencies. The German empire in 1900 adopted for the empire the Prussian Code, which is a Germanized version of the Code Napoleon; and Japan, as part and parcel of her scheme of civilization, has within recent years enacted a code of law on French lines, following closely even its minor details, thus writing the law of Rome—the Codes of Justinian and of Napoleon—into the jurisprudence of the remote islands of the sea.

9. *Resemblance Between the Civil Law and American Law.*—Aside from matters of procedure and minor detail, the actual differences be-

tween the living Civil Law as it exists throughout the world and the English common law, as refined and modified in this country and now administered here, are not great, certainly not greater than we should reasonably expect, having regard to the controlling influence,—conscious and unconscious—of the Civil Law, upon the growth and development of the common law in England, and having in mind the fact that many English judges, notably Mansfield and Holt, and several of the chancellors for the past 200 years at least, have professedly drawn copiously from the great reservoir of Roman jurisprudence, whenever occasions have arisen for modifying or extending common law principles or for applying them to new conditions of fact and circumstance. The so-called Common Law of England, certainly from the 11th century, is, in reality, largely the Custom of Normandy and the Custom of Paris, as imported at the Conquest in 1066 A.D. Its scientific terminology and its exact legal language even in its present form are essentially French. Chief Justice Holt nearly 200 years ago said: "Inasmuch as the laws of all nations are doubtless raised out of the ruins of the civil law, as all governments are sprung out of the Roman empire, it must be owned that the principles of our law are borrowed from the civil law, and, therefore, grounded upon the same reason in many things." (12 Mod. Rep. 482.) Sir William Jones, writing during the Revolutionary War, said: "With all of its imperfections, the Digest is a most valuable mine of judicial knowledge; it gives law at this hour to the greatest part of Europe, and though few English lawyers dare make such an acknowledgment, it is the source of nearly all our English laws that are not of feudal origin." And Mr. Hornblower, addressing the New York State Bar Association (1902), has just said: "It is also well for us votaries of the common law to remember that there is another jurisprudence founded upon the Roman or the Civil Law, and prevailing throughout the greater part of continental Europe, from which we have ourselves borrowed many of the most important legal principles." If we eliminate from the law of England as it obtains in this country, our technical rules of evidence, which have grown up about our system of trial by jury, our pleading and the peculiarities connected with the tenure, transmission, and devolution of real estate (which are each of them, for the most part, little more than an antiquated mass of ignorance and rubbish, of which it is the modern tendency of our American jurisprudence to relieve us), the rest of our system is not very different, at least in its elements, from modern Civil Law. The following subjects in American law may be mentioned, which have been largely influenced by the Civil Law, and resemble that system in many important elementary principles, namely, the subject of probate, of succession to personal property and testamentary capacity; the law of admiralty; the law merchant, largely of continental origin; the law of equity and trusts; the law of corporations as juridical persons distinct from the corporators; the law of *res judicata*, fully expounded in the Digest of Justinian; the theory and practice of *habeas corpus*, the leading principles of which are found in the same compilation; the law of alluvion, of accession, and of

wild animals; and finally the great subject of obligations in general as arising from contract, *quasi* contract, tort, neglect, and the operation of law, the logical arrangement of which by the civilians becomes more and more useful in legal analysis and discussion. To these we may add the general doctrines of public and private international law which are mainly of continental origin. (Howe, Roman and Civil Law in America, 16 Harv. Law Rev. 342.)

10. *The Importance of the Civil Law in America.*—The present practical importance of the Civil Law to us consists in the fact that about one sixth part of the present population of the United States and its dependencies—or, to put it in figures, more than 12,000,000 of our population—live under the civil law, and are governed in their personal and property rights by some form of it. Thus Louisiana, with a population of 1,400,000, Porto Rico, with a population of 1,000,000, the Hawaiian Islands, with a population of 150,000, the Philippine Islands, with a population of 8,000,000, and Cuba (if indeed it may be included), with a population of 1,600,000, are governed by the civil law. Not only, therefore, must our judges and lawyers acquire familiarity with it and facility in working in it, but our commercial and trading classes are finding it constantly of more and more consequence to them in their business. Not only is much of our law derived from it, but many millions of our people live and must continue to live under it. It is a curious fact that the Custom of Paris was in force in Michigan and Wisconsin down to the year 1810, when it was formally abolished, in Michigan at least, by the legislature of that State. (18 Wis. 158; 8 Mich. 25.) All the French colonies established in the 17th and early part of the 18th century in North America were governed by the Custom of Paris, which still remains in Quebec the basis of the codified law of that province. By a royal ordinance the laws, edicts, and ordinances of France and the Custom of Paris were extended to Louisiana, and that system of law thus introduced prevailed there until 1763, when France ceded the country to Spain. That introduced the Spanish law into Louisiana, which was, however, only another form of the Civil Law. In 1808 a Civil Code was adopted by the Territory of Orleans based to a considerable extent on the Code Napoleon, and, as revised in 1825 and subsequently, constitutes the present Louisiana Code. We probably owe to the study of Blackstone's Commentaries much of the unreasoning prejudice which has hitherto existed to some extent in this country against the study of the Civil Law. Blackstone began to be read by law students in America about 140 years ago, and from then to now has been for the most part the initial text-book for all lawyers and law schools. He writes bitterly in his first lecture about the civil law. But it is manifest that he wrote without knowledge and under the influence of a set of political prejudices, and with a bias and prepossession with which we in the United States may well have little sympathy. Abstractly, there is no more reason why Americans should entertain a prejudice against the Civil Law than against the law of gravitation, and there are cogent reasons, practical as well as scientific, why we should—now at least when it has become a matter of real personal

## CIVIL LIST—CIVIL RIGHTS BILLS

concern to so considerable a part of our people—give serious attention to modern Civil Law.

**Civil List**, a term signifying in the United States, (1) a list of the entire expenses of the civil government, (2) the revenue appropriated to support the civil government, (3) the officers of the civil government who are paid from the public treasury.

In England the meaning of the term formerly represented the whole expenses of the government with the exception of those of the army, navy, and other military departments. It is now limited to the expenses proper to the maintenance of the household of the sovereign. It was once a principle in England, as in other Teutonic nations, that the monarch was to pay all the expenses of government, even including those of the army, from the possessions of the crown, the domains, and that the subjects were not obliged to contribute anything more than they voluntarily engaged to. From this principle, which is proved by the history of the origin of the domains, it appears that the crown lands in general cannot be considered the private property of the ruling family. On the contrary, they are, in general, the property of the state, and have been given to the prince to defray the expenses of government. Until the Restoration the whole expenses of the government continued to be defrayed out of the royal revenue. The first Parliament of Charles II. fixed on £1,200,000 (\$6,000,000) as the ordinary revenue of the crown in time of peace. For this they provided by taxation, which ultimately produced more than the amount of the grant. The same taxes were continued during the reign of James, and produced on average £1,500,000 (\$7,500,000), besides which he received extraordinary grants. At the commencement of the reign of William, the Commons made still further restriction on the royal control of the revenue. They voted £1,200,000 (\$6,000,000), as the revenue of the crown in time of peace, one half of which was appropriated to the maintenance of the king's government and the royal family, the other to public and contingent expenditure. The outbreak of war prevented this arrangement from being exactly carried out, but the Commons maintained

the principle of separating the regular and domestic expenses of the king from the public expenditure, and establishing a systematic and periodical control over the latter. The amount actually voted to the king for life in 1697 was £700,000 (\$3,500,000) and the same vote was made at the commencement of the reign of Queen Anne and George I. On the accession of George II. £830,000 (\$4,150,000) was voted. Besides the regular vote, grants had been frequently made to defray debts incurred in the expenditure of the sovereign. On the accession of George III the civil list was fixed at £800,000 (\$4,000,000), but instead of being paid out of appropriated revenues in which the crown lands were included, these were surrendered, and it was charged on the ordinary taxation. Large extra grants had to be made during this reign. At the commencement of the reign of Victoria a civil list of £385,000 (\$1,925,000) per annum was settled on her majesty for life for the support of the royal household, and the maintenance of the dignity of the crown, £60,000 (\$300,000) being allotted to the privy purse. In 1901 the civil list of King Edward VII. was raised to £470,000, (\$2,350,000); £110,000 of this being for the privy purse. Many continental states have a fixed civil list; that of Russia is equivalent to \$7,050,000; of Turkey, \$4,600,000; of Austria, \$3,650,000; of Prussia, \$4,500,000.

**Civil Procedure.** See COURT.

**Civil Rights Bills.** 1. An act to carry out the intention of the Thirteenth Amendment, prohibiting slavery—which it was alleged the Southern States were attempting to nullify by public and private action—and secure the political equality of the ex-slaves with the whites. It provided that all persons born in the United States and not subject to any foreign power, excluding Indians not taxed, were citizens of the United States, and entitled to the same immunities, irrespective of race or color, or previous condition of servitude, except as punishment for crime; punished as a misdemeanor any deprivation of such right under color of State law; transferred cognizance of such cases from the State to the Federal courts; intrusted the execution of the act to national officers only, and fined them for refusal; punished resistance to the officers; provided for fees; empowered the President to send officers to any district where the act was likely to be violated, and to call out the national forces to execute it; but permitted an appeal to the supreme court. Significantly, it employed somewhat the same means to emancipate the negro which the Fugitive Slave Law did to re-enslave him, especially in over-riding or supplanting State officers; and for the same reason—they could not be trusted in the sections where it was to be enforced. The bill was passed in the Senate 2 Feb. 1866, 33 to 12; in the House 13 March 1866 to 38. Andrew Johnson vetoed it 27 March, and it was passed by the requisite two thirds over his veto, in the Senate 6 April and in the House 9 April. Even so, the debate had brought out two grave doubts of its constitutionality; that the protection of civil rights under the Constitution belonged not to Congress but to the States, and that under the Dred Scott decision (which stood as a precedent for the supreme court until reversed), negroes could not become citizens even by emancipation. This led to the proposal of the Fourteenth

## CIVIL RIGHTS CASES — CIVIL SERVICE

**Amendment** (see *CONSTITUTION, Amendments*), which passed both Houses in June.

2. An act extending the foregoing to the exclusion of negroes from juries, and from equal privileges in schools, public conveyances, hotels, theatres, etc. This had been persistently urged by Charles Sumner, for some years before his death; was offered as an amendment to the Amnesty Bill of 1872, and lost by only one vote; again introduced into the House in December, and referred to a committee; on 30 April 1874, a few weeks after Sumner's death, it passed the Senate, but the House rejected it; it finally passed both Houses in February 1875 and was signed 1 March. For an account of its partial invalidation, see next article.

**Civil Rights Cases.** These were five test cases in the United States supreme court of the constitutionality of sections 1 and 2 of the second Civil Rights Bill, described above; decided in one group, October term, 1893, and reported and cited under the title above. All came up from circuit courts; three on certificates of division of opinion, two on appeal for error; and while the decision on the act was adverse to all, and the first three were found for defendant, the error was admitted and the decision given for plaintiff in the last two. Two of them were for hotel discrimination, two for theatre discrimination, one for railroad discrimination; the first four submitted 7 Nov. 1882, the last one 29 March 1883. The cases were: *U. S. v. Murray Stanley*, from the Kansas district: hotel case. *U. S. v. Michael Ryan*, California district; refusing a negro a seat in the dress circle of Maguire's Theatre, San Francisco. *U. S. v. Samuel Nichols*, Western Missouri district: hotel case. *U. S. v. Samuel D. Singleton*, southern New York district; refusing a negro a seat in the Grand Opera House, New York. *Richard A. Robinson*, and *Sallic A. Robinson* his wife, against the *Memphis & Charleston R.R. Co.*: refusal to allow the wife a seat in the ladies' car from Grand Junction, Tenn., to Lynchburg, Va. The decision of the court was given by Justice Bradley, Harlan dissenting. The terms of the first section of the act are that "All persons within the jurisdiction of the United States shall be entitled to the full and equal enjoyment of the accommodations, etc., of inns, public conveyances by land or water, theatres, and other places of public amusement," and that laws must be "applicable alike to citizens of every race and color, regardless of previous condition of servitude." The second section affixes penalties. The court held that these two sections are unconstitutional as applied to the States, not being founded on either the Thirteenth or Fourteenth Amendment (see *CONSTITUTION, Amendments*): the former merely prohibits slavery, which is not constituted by a denial of civil equality; the latter is prohibitory merely on the States, not on individuals, and it was not alleged that the discrimination was made under State laws. Congressional legislation for enforcing the latter amendment is not direct legislation, but corrective, counteracting or redressing State legislation of a sort forbidden by the amendment. For private injury from discriminations, the remedy must be sought in State laws — to withdraw it from which was the precise object of the act.

**Civil Service**, that branch of the public service which includes all executive offices not connected with the army or navy. The term is not applied to the direct representatives of the people, as the President of the United States or the governor of a State. Owing to the complexity of modern government and the variety of its functions, the civil service has become very complex, and the problem of its effective administration a difficult one.

In Great Britain the service comprises various departments, such as the home office, the foreign office, the war office, admiralty, post-office, customs, excise, etc. Formerly, appointments to the civil service in Great Britain were the gift of the executive government, and were obtained by influence, while the bestowal of them was used as a means of gaining parliamentary support on behalf of the government. Those appointed were not generally called upon to show whether they were competent or not. In 1855 examinations were instituted to test the efficiency of all candidates for subordinate posts; but for some time candidates were specially nominated for those posts. As more than one might be nominated for a post, competition was gradually introduced, and in 1870, it was directed that appointments in the civil service should (with certain exceptions) be filled by open competition, as was already the case with appointments in the Indian civil service. The appointments to what are known as clerkships in the civil service are divided into two classes or divisions, with different age limits and salaries. In the higher division, while the examinations are more severe, the salaries are much better; the two divisions are kept quite distinct; and it is rare for a person to be promoted from the lower to the higher. For a number of appointments open to competition special qualifications, scientific or technical, are necessary, while there is also a special limit of age. A large number of subordinate appointments in the postal and telegraph service, the excise, etc., are on a different footing from the clerkships just mentioned, and are not so well paid. All persons who have served in an established capacity in the permanent civil service are given a pension, varying with the length of service, at the time of retirement. The total expenditure of the civil service of Great Britain is about \$90,000,000.

In the United States the Federal civil service numbers over 100,000 officials in the various administrative departments. The Constitution provides that the President, "with the advice and consent of the Senate," shall appoint all officers of the United States whose appointments are not otherwise provided for by the Constitution. This gives the chief executive power to choose the heads of departments, as well as their subordinates. In the separate States the appointive power of the chief executive is much more limited. The heads of the State departments such as the attorney-general and comptroller, etc., are elected by the people, and usually have the constitutional right to select most of their own subordinates. The governor therefore appoints only his own secretaries, etc., members of commissions, heads of bureaus, and the like. With the development of party government in the United States, the patronage placed in the hands of elected officers through their power of appointment, has led to

## CIVIL SERVICE REFORM

the giving of offices as a reward for party service (the spoils system), and to considerable inefficiency and unnecessary expense in public administration. A reform is being brought about by the appointment of officials according to merit in public examinations. See CIVIL SERVICE REFORM.

**Civil Service Reform**, the improvement of the civil service in methods of appointment, rules of conduct, etc.; in the United States, the movement for the appointment of public servants according to their fitness for their work, rather than their services to the party in power.

In the year 1835 a debate took place in the Senate of the United States on the condition of the civil service, and especially on the abuse of the power of appointment and removal to serve party ends instead of public ends. Among the senators who took part in the debate were the three whom history has judged the strongest in that famous body, Daniel Webster of Massachusetts, Henry Clay of Kentucky, and John C. Calhoun, of South Carolina. Differing widely in their views of party policy and rivals in ambition, they were of one mind as to the true nature of the public service, and as to the errors and evils that had crept into it. Mr. Webster, then in the prime of his young manhood, had already won the title of the "Great Expounder of the Constitution." He thus stated the idea in which the others heartily joined: "The theory of our institutions is plain; it is that government is an agency created for the good of the people, and that every person in office is the agent and servant of the people. Offices are created, not for the benefit of those who are to fill them, but for the public convenience."

There is no doubt that this is indeed the true theory of our institutions. It is to be found in all the early writings of the men who formed the government. It is the basis of the Declaration of Independence, that "governments are instituted among men" to secure the rights of "the governed" from whose consent "they derive their just powers." When our national government was founded it was the only one in which offices were not a privilege, but a trust, imposed by the choice of the people and for their sole interest. Neither birth nor rank, nor wealth gave any title to them. Each of the men who held them was intended to be, in the words of Webster, "the agent and the servant of the people."

This theory had grown out of the needs of the American people, and fitted them closely. As colonists they had had to work and fight hard for the right to live and the means to live as free men in a wild land, far from the homes of their fathers, amid many perils and hardships. There was no ruling class among them. To attend to the common business of each little settlement, they were led to choose among their own number the agents best fitted for the task. These in the early days were, as in the towns of New England they still are, "select-men," "trustees." The name shows what was expected of them, and what was their title to employment. As the towns were grouped in counties and the counties in States, the public business grew, became more complex, and required a larger number of agents with different duties and powers, but the idea held. They were still agents, selected men, trustees. From the most modest

unpaid village or town officer to the President of the United States, the Commander-in-Chief of the army and navy of the nation and its representative in the eyes of the world, no man in the public service in this country is anything but the agent, the trustee of the people.

One result of the growth of the public business has been that only a small part of the agents for doing this business are chosen directly by the people. Those thus chosen are entrusted with the employment or appointment of a very large number of others. The chief difference between the two classes is that those elected are expected to carry on the public business in a way that the majority of the voters are in general agreed upon. They are the choice of the majority party and, so far as the rights of all permit, they are the agents of that party. When the views and wishes of the majority change, these agents are usually changed also. But the far greater number of agents for doing the public business are appointed or employed. The duties of nearly all these are the same no matter what may be the policy of the majority party. In the national government, for instance, the main work for those in office, except the highest, is the collection and expenditure of the taxes. The taxes are collected on goods brought into this country for sale or on goods made here for sale; in other words, customs, duties, and internal revenue taxes. Parties differ widely as to which class of taxes should be the higher, and as to how high the custom duties should be. But all parties agree that the taxes of all sorts should be collected according to law, honestly and fairly, that the money should be carefully accounted for, and none of it stolen or wasted. Agents for this purpose need to be good business men of character and ability; they do not need to be of one party or another. Again, the Post-office Department does a great part of the business of the government. It collects mail matter of all kinds, transports it, delivers it at home or abroad, makes large payments on money orders, and sells the stamps by which the cost of its work is paid. As to this work, there is no difference at all between parties, and there has never been. The agents engaged in it need only to be honest and efficient. They do not need to be of one party or another. In all offices where the duties are of this sort, it is plain that those engaged in them should be selected for merit only, promoted as the service requires, and removed only for failure or incapacity to do their work in the best manner.

Such a policy would answer to Webster's statement of the theory of our institutions, and to the practice of the early Presidents. Washington declared: "In every nomination to office I have endeavored, so far as my own knowledge extended or information could be obtained, to make fitness of character my primary object." In the first 39 years of the history of the government the six Presidents made only 112 removals. A few years later, when Webster had to define anew the true theory of the public service, a very different practice had grown up. It was frankly described in that same debate by Mr. Marcy, a senator from New York. He said: "The politicians of the United States are not so fastidious as some gentlemen are as to disclosing the principles on which they act. They see nothing wrong in the rule that to the victor belongs

## CIVIL SERVICE REFORM

the spoils of the enemy." This theory is plainly the opposite of the true one. Under it elections do not merely settle the policy of the country, as to which parties may unselfishly differ. They become contests for spoils as well, and tend to become more and more contests for spoils and less disputes as to principle. The spoils are the offices, the places of trust, and these tend to be given not to those best fitted to perform their duties, but to those who have claims on the party. The service is hurt by putting out tried men and putting in untried men, and since the untried men are chosen for other reasons than fitness, they are apt to be poorer officers. Since they owe their employment to party favor, and do not get it on their merits, they are likely to be less faithful and less honest. They are liable to be turned out at the next election, and they are tempted to make all they can from their places. The offices tend to be regarded as created not "for the public convenience" but "for the benefit of those who fill them." The service tends to become poorer, less honest, more costly. Any large private business conducted in this way would surely come to disaster. So would the business of the government if it had not the pockets of the taxpayers to draw on.

*The Spoils System.*—The spoils system prevailed in the service of the United States government for about a half-century after 1830. It also prevailed in greater or less degree in the service of the several States and of the larger cities. It was not confined to any one party. All were more or less corrupted by it. The effect on the politics of the country was very bad. The pressure for public employment, always strong, became extreme. Probably the election of 1860 was as largely decided by moral conviction as any in the history of the country. Yet, one month after he took office, President Lincoln groaned under the burden of this pressure. "I wish," he wrote, in his simple phrase, "I could get time to attend to the Southern question. I think I know what is wanted, and believe I could do something toward quieting the rising discontent, but the office-seekers demand all my time. I am like a man so busy letting rooms in one end of his house that he cannot stop to put out the fire that is burning in the other." In the crisis of the war for the Union he was visited by a committee of New York politicians, intent on patronage. The chairman opened his address with a reference to the "awful burden of the nation's fate weighing on the president." "Gentlemen," interrupted Mr. Lincoln, "it is not the fate of the nation that worries me most just now; it is your pesky post-office." These incidents throw a strong light on the waste of time, of money and of strength imposed by the spoils system. The degradation and pollution of politics were even worse effects. The office-holders, living on the spoils of the place, and greedy for more, seized the organization of their party, whichever it happened to be, and made the free exercise of honest preference among the voters difficult and often impossible. The scramble between factions in the party in possession became as intense as between opposing parties. In the Custom House in New York, five collectors of the same party made 1,878 removals in a period of 1,565 business days, and the service grew steadily worse. In 1881, Guiteau, an office-seeker from

New York, where a bitter factional fight had long been raging, half-crazed with disappointed greed, assassinated President Garfield, to whom he charged his failure.

*The Merit System.*—This proved the turning point. At the next session of Congress bills were introduced for the establishment of the merit system, and a law was passed in January 1883. It was entitled "An Act to Regulate and Improve the Civil Service of the United States." The object of the law was to secure appointment and promotion in the service for fitness. For this purpose appointments were to be made from those graded highest as the results of open competitive examinations, the appointments being made final only after a period of probation or trial. This system was to be extended throughout the service as fast and as far as the President should direct. When any part of the service was to be brought under the system, it was to be arranged in classes by order of the President; hence the term "classified service" means, under the law, the part of the service in which the merit system is applied. Within the classified service, the examinations for appointment and for promotion are chiefly competitive; that is to say a list, called an "eligible list," is made of all applicants passing a fixed grade, in the order of their standing, and a selection is made by the appointing officer from the three highest on this list. This selection is for the period of probation or trial, six months, at the end of which term, if his conduct and capacity are satisfactory, the probationer is absolutely appointed; if not, he is discharged. Non-competitive examinations are held according to the rules laid down by the President. In these all applicants passing a fixed grade are eligible to appointment without regard to their relative standing. The rule as to probation is the same as in the other cases. The law requires that all "examinations shall be practical in their character, and as far as may be shall relate to those matters which will fairly test the relative capacity and fitness of the persons examined to discharge the duties of the service into which they seek to be appointed." Close attention is paid to this requirement. In the first place, weight is given to the experience of the candidates in the kind of work they seek, when such experience can definitely be known. Then each class is tested as to the knowledge and skill particularly needed. For clerks and accountants, weight is given to accuracy and quickness in figures, to clearness and rapidity in writing, and to familiarity with the principles and methods of book-keeping. Examinations are generally for entrance to the lower grades of the service, and actual excellence in the performance of work counts in promotion. For places requiring special knowledge, trained examiners are employed. For instance, the examiners who set the questions and rated the answers in the case of the supervising architect were prominent architects from various parts of the country. They were able, from the records of the candidates, to test not only professional knowledge, but business capacity. In all cases the examiners are selected from those who are well informed as to the work to be done. The application of this law is to be carried out and watched by a commission, known as the United States Civil Service Commission, made up of three members,

## CIVIL SERVICE REFORM

appointed by the President with the advice and consent of the Senate. This commission aids the President in the formation of the rules under the law, and, with the aid of examiners, sets and conducts the examinations. All appointing officers are required to report to it all changes in the classified service, of which the commission keeps a full record, as well as of its own examinations and other proceedings. All officers of the service are required to aid in the performance of the duties of the commission.

One of the worst evils of the spoils system was the fact that public employees were made to pay a large fraction of their salaries to party funds, and another was that these employees were forced to work for the party in power in order to keep their places. Both these practices are now forbidden by law in the service of the United States. No one in the service is allowed to use his official authority or influence to coerce the political action of others. All persons in the service are forbidden to ask or receive political contributions from others in the service. Such contributions cannot be solicited in any place or building used by the government. By the rules, which have the force of law, no question can be asked of candidates for appointment as to their political or religious opinions; no disclosures of such opinions can be considered; no change of rank or pay can be made because of such opinions. Under the spoils system, the office-holder got his place from his party and was taxed heavily by his party managers. The law intends to put a stop to that; it holds the officer bound only to earn his pay by honest work, and free to spend it as he chooses. The law further holds him without fear of harm or hope of aid from outside, to do his duty to his employers, the whole people of the United States. It aims to put the people and those who work for them on the same footing that is maintained in honorable private business between employers and employed.

The merit system has been greatly extended since the passage of the law. Under President Arthur, who signed the law in 1883, some 16,000 places were brought within its provisions. The number is now over 80,000. This is nearly a half of all the places in the executive service, while the salaries paid in these places are nearly three fourths of all paid in the service. While this advance has been made there have been more frequent changes of party in the government of the country than in any like period in our history. In the five elections since 1883, four have resulted in a change of party. Each succeeding President until the present has, in the discretion which the law confides to the President only, added to the number of places removed from the spoils system. President McKinley withdrew a considerable number of places from the merit system for reasons urged upon him by the heads of some departments. The effect has been unfortunate. On the other hand, the merit system has been extended to the service in the Philippine Islands in a way that promises to make the work of governing there clean, efficient, and fair to a degree that could hardly have been looked for. In this region the bond of trusteeship rests upon our government with a peculiar and solemn obligation. The United States have taken control of the affairs of the people of these islands as the result of a war with Spain, without the assent of the peo-

ple in the first instance, and against resistance by a portion of them which was overcome by arms. It would be a sore disgrace, if their affairs were not managed honestly and purely and for the interest of the governed. The merit system on the lines of the Civil Service Law has been established there, under the general guidance of an experienced and skilled examiner from Washington. As many natives as practicable are being employed. It is still too early to judge of the final outcome, but the beginning is promising.

The chief aim of the merit system is, on the one hand, to get the best service for the government—that is, for the people—and, on the other hand, to remove from the party contests of the country the corrupting influence of the vast number of business places offered as spoils to the victors. The methods of competition and probation are not perfect, and, like all other human methods, are liable to mismanagement. But they are the best that have ever been tried, and they are very effective. The test of competitive examination is shown to be thorough and practical by the fact that only a very small number of those who pass that test are dropped after probation or trial. Another proof is the much larger amount of work done by persons so selected. During 10 years before the adoption of the merit system in the departments at Washington the number of clerks increased from 3,300 to 5,523, or more than two thirds. In the 13 years after the system was adopted the number actually fell off 211, or three per cent, while the work of the departments had largely increased. Another proof of the efficiency of the system is the small number of changes that take place in it compared with those that take place in the branches of the service where the system is not yet applied.

Two facts are noteworthy with regard to the effect of the use of the merit system on partisan contests in politics. The total cost of the executive service is over \$100,000,000. Of this nearly \$75,000,000, or three fourths, is now paid to those employees who are under the merit system. This very large sum is no longer held out as prizes for partisan activity, or treated as the "spoils of the enemy." The other fact is that the feeling of the people that the government is theirs, and does not belong to the party in power for the time being, is greatly strengthened. The entrance examinations are held in all parts of the land, and men and women are selected for the departments at Washington with no regard whatever for their party views or the influence of politicians. This has been of great effect in laying to rest the passions bred by the Civil War, and giving to the dwellers in the South a sense of their common rights and duties as citizens of the nation. It is a great and lasting gain.

In 1884, laws for the introduction of the merit system were enacted in New York and Massachusetts, and later laws authorize the system in the service of cities in Wisconsin and Illinois. In Massachusetts and in New York the system has made much progress and the results have been good in proportion as the system has been extended and honestly and faithfully applied. But the evils of the spoils system still prevail almost without check in the service of the cities and the States throughout the country. The enormous number of

## CIVIL WAR IN AMERICA

places involved are still almost wholly the prizes of party contests. The place-holders, many times more numerous than the present army of the United States, are in greater part enlisted for party rather than for public service. Efficiency, industry, and economy in the public work are hard to secure. The suppression of vice and the decent administration of the affairs of cities and States are made more difficult.

Clearly it is best that the merit system should be applied to all that portion of the civil service in which the duties are of a business nature and in which the office-holders are not called on to fix the policy of the government. There is no Democratic or Republican or Populist way of being honest and industrious and intelligent which all Americans may not use. To these qualities in their service the people have a right, and no party can claim a monopoly of them. Much remains to be done to complete the work so well begun. The men in all parties who look on public employment, not as a trust, but as the spoils of party victory, resist all advance and seek to undo what has been done. They cannot succeed if the true nature of the merit system is understood, its honesty and fairness, its high utility, and its fidelity to the fundamental principle of the free institutions of the American republic.

EDWARD CARY,

*Associate Editor New York Times.*

**Civil War in America.** The number of engagements entered in the government's 'Chronological List of Battles' exceeds 2,200. An alphabetical list of battles compiled at the bureau of pensions, including such minor actions and skirmishes as seemed worthy of incorporation, contains over 6,800 separate affairs. It is therefore clear that, even in a comprehensive narrative of the War, a large number of the lesser engagements must be ignored. Merely to state strength and losses for the battles mentioned would form a lengthy statistical article. For these figures the student is referred to the separate accounts in this work of the various battles herein treated.

The Civil War of 1861-5 was inaugurated by the determination of seven Southern States to withdraw from the Union. South Carolina led by passing an ordinance of secession 20 Dec. 1860, followed by Mississippi, 9 Jan. 1861; Florida, 10 January; Alabama, 11 January; Georgia, 19 January; Louisiana, 26 January; and Texas, 1 February. On 7 February the Choctaw Nation declared its adherence to the Confederacy.

During the autumn of 1860 and the early spring of 1861 the forts, arsenals, custom-houses, and other government property in those States, with few exceptions, had been seized by State troops, and large sums were voted for arming the States, Georgia leading in November 1861, by appropriating \$1,000,000. Major Robert Anderson, a Federal officer, who held Fort Moultrie on the inner line of Charleston harbor, becoming aware of active preparations for capturing that work, withdrew, on the night of 26 December to Fort Sumter in the centre of the harbor. This move hastened results. Immediate preparations were made for bombarding the fort. The first firing upon the flag was 9 January by the batteries erected against Fort Sumter, the inciting cause being the appearance of the *Star of the West* off the harbor. This vessel had

been sent from New York with provisions for Sumter, and with the accompanying fleet withdrew without replying to the fire.

Delegates from the seceded States met at Montgomery, Ala., 4 February, and 8 February adopted a provisional government, "The Confederate States of America," and the next day elected Jefferson Davis of Mississippi President, and Alexander H. Stephens of Georgia Vice-President of the Confederacy.

On 1 March Gen. P. G. T. Beauregard, appointed by the Confederate government, was sent to Charleston and took charge of the preparations for reducing Fort Sumter. On 4 March Abraham Lincoln was inaugurated as President of the United States. On 10 April Beauregard was instructed to demand the surrender of the fort, and, in case of refusal, to reduce it. The next day Anderson received and promptly declined a demand to evacuate, and at daylight 12 April, the Confederate batteries opened upon Fort Sumter, compelling its surrender on the 14th. The expectation of a relieving fleet probably hastened this attack.

With the news of the attack and surrender the country received President Lincoln's proclamation calling for 75,000 volunteers, and summoning Congress to meet on 4 July. In an instant discussions over the power to coerce States, the discussions of peace conventions and movements, and all similar perplexing questions were brushed aside, and the North responded with intense enthusiasm, the predominating sentiment being the preservation of the Union. The South was equally aflame, rallying under the banner of State rights.

On 8 April President Davis had called for 20,000 volunteers, and the day following President Lincoln's proclamation he asked for 34,000. Two days later the Confederate Congress authorized the raising of 100,000 men. Three days after the surrender of Sumter Virginia seceded, followed 6 May by Arkansas and Tennessee, and 20 May by North Carolina, the belief being then general that a policy of coercion had been decided upon. The harder States of Kentucky and Missouri were held to the Union by their loyal element, and Maryland was held at first by the direct power of the national government, and later by its own loyalty. The first two were represented in the Confederate Congress throughout the War. The movement to take Missouri into the Confederacy was thwarted by Gen. Nathaniel Lyon, who captured Camp Jackson near St. Louis 10 May, and on 17 June, having already taken the State capital, in a brief engagement dispersed a force which Governor Jackson had gathered at Booneville. This resulted in relieving the capital from those plotting secession. Kentucky at first declared for neutrality, but at the election for members of Congress, 20 June, it was made clear that the State was lost to the Confederacy. In May the Confederate capital was moved from Montgomery, Ala., to Richmond, Va., where troops from all parts of the Confederacy were rapidly assembling. In like manner, the Northern States were pouring troops into the national capital, and Washington soon became a vast military camp. The Union forces crossed into Virginia 24 May and encamped opposite Washington.

For a brief time Baltimore resisted the passage of troops to the capital. Four hundred Pennsylvanians reached Washington 18 April,

## CIVIL WAR IN AMERICA

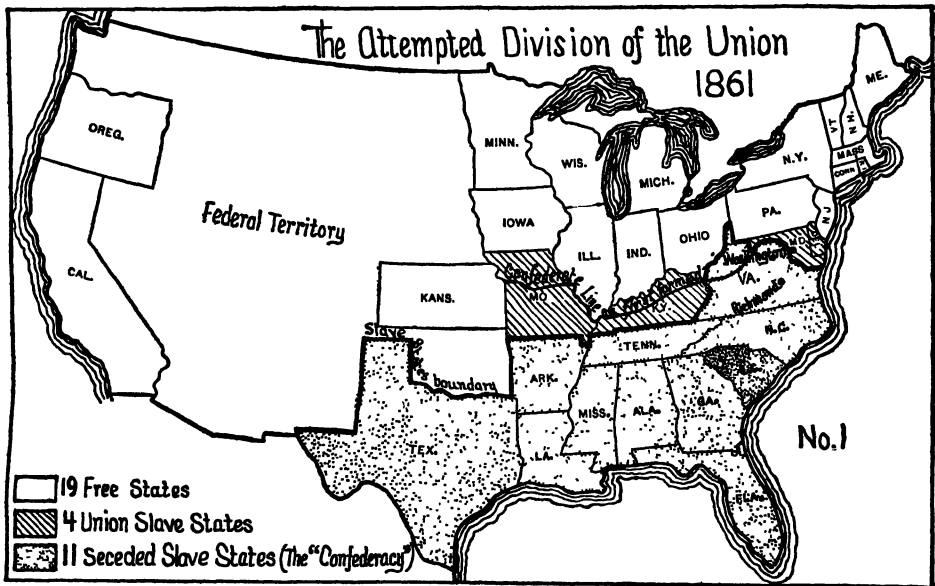

but the 6th Massachusetts regiment was attacked in Baltimore 19 April. The 7th New York reached Washington 25 April from Annapolis. Brig.-Gen. B. F. Butler, with the 8th Massachusetts, had reached Annapolis on the 20th, and on the 22d had proceeded to the Relay House. On the night of 13 May he occupied Baltimore, and thereafter the route to Washington was unobstructed. Harper's Ferry, with its arsenal and machinery for manufacturing small arms partially destroyed, was seized by the Confederates 19 April, and Gosport Navy-Yard, near Norfolk, 20 April, with guns, stores, ships, and machinery of immense value.

On 20 May Gen. Butler, having been made a major-general of United States volunteers, was assigned to the command of the Department of Virginia and North Carolina, with headquarters at Fort Monroe. On 10 June he moved against a force under Gen. J. B. Magruder at Big Bethel and was defeated. While it was comparatively a small affair, like another about

Congress met in special session 4 July. It legalized all President Lincoln's acts with respect to the army and navy, and authorized a further call for 500,000 men, a national loan of \$250,000,000, and an increase of the navy to render effective the blockade of the Southern ports which had been declared 19 April by President Lincoln.

Following the Philippi defeat, the Confederates sent Gen. Henry A. Wise to the Kanawha Valley, and Gen. Robert S. Garnett to Beverly. Gen. William S. Rosecrans, who was commissioned brigadier-general in the regular army 16 May, joined Gen. McClellan from Ohio, and 11 July defeated the Confederate forces under Col. Pegram at Rich Mountain. On 13 July Gen. Garnett, during the retreat of his column, was killed at Carrick's Ford. His command escaped, leaving Gen. McClellan in control of northwestern Virginia.

The latter part of July, upon hearing of the arrival of Gen. J. D. Cox of Ohio in the

the same time at Vienna in front of Washington, both caused widespread dissatisfaction and mortification at the North.

Under President Lincoln's call Ohio promptly organized 13 regiments, and 23 April Capt. George B. McClellan was appointed major-general of Ohio militia. On 14 May he was commissioned major-general in the regular army and assigned to the Department of the Ohio, embracing that State, Indiana, Illinois, and, later, West Virginia. In May the Confederate government had despatched a small force to Grafton, W. Va., under Col. Porterfield, with the purpose of breaking the Baltimore & Ohio R.R. On 26 May Gen. McClellan threw troops from Ohio and Indiana into the State, defeating Porterfield at Philippi, 3 June. West Virginia seceded from Confederate Virginia 17 June, and set up a State government which was recognized by President Lincoln on the 20th. On 9 July United States senators were elected, and on the 13th they took their seats at Washington.

Kanawha Valley, Gen. Robert E. Lee was ordered to the command of West Virginia. The campaign for regaining the State failed, and by November the Confederate authorities decided to abandon the plan of occupying it. Gen. Lee was ordered to the command of the Department of South Carolina, Georgia, and Florida.

Early in July the army in front of Washington under Gen. Irwin McDowell prepared to move against the main Confederate army under Gen. Beauregard in front of Manassas. The flanks of each army toward the Shenandoah were protected by strong forces, Gen. Robert Patterson commanding on the Union side, and confronting Gen. Joseph E. Johnston.

The Union advance was hastened by an almost universal cry in the North of "On to Richmond!" Gen. McDowell left his camps on the Virginia side of the Potomac on the afternoon of 16 July with five divisions, encountering an advance brigade of Beauregard's army at Fairfax Court-House. This, with two other

## CIVIL WAR IN AMERICA

brigades, withdrew with light skirmishing to the main lines, which had been established behind Bull Run, its right at the crossing of the railroad from Manassas to Alexandria, and its left at the crossing of the Warrenton turnpike from Alexandria. McDowell's forces were concentrated about Centreville on the 18th, and one brigade had quite an affair on that date at Blackburn's Ford. On the 20th Gen. Johnston arrived with all except one brigade of his army and assumed command. On the 21st McDowell, feinting in front, turned the Confederate left, and maintained a successful battle until near four o'clock, when the last brigade (three regiments) of Johnston's army arrived with a battery on the Union right and checked its advance. A brigade of Gen. Beauregard's troops moving farther to the left and more directly on the Union flank, changed this check into a retreat, which soon became a panic, and the entire Union army left the field in disordered haste. There was slight pursuit, but the panic increased, and only ended when the army was inside the fortifications of Washington. The North was astounded at the result, and the South correspondingly elated. Both sections immediately redoubled their efforts to prepare for vigorous war. Gen. McClellan was summoned from West Virginia and given command of the Department of the Potomac, and began to organize the troops pouring in from all parts of the North. On 20 August he took command of the Army of the Potomac, then for the first time organized under that title, and 1 November he was made commander-in-chief of the armies of the United States in place of Gen. Winfield Scott, who had asked to be retired on account of failing health. In the rapid organization going forward in both sections, the South had the advantage of the services of the majority of regular officers from that section who resigned their commissions and went with their States.

After Bull Run there was little heavy fighting during the remainder of 1861, both sides devoting their chief attention to establishing their lines. On 15 August Jefferson Davis ordered all Northern men to leave the South within 40 days; and the next day President Lincoln proclaimed the seceded States in insurrection and prohibited all intercourse. On the Union side, Gen. Butler in command of a joint expedition of land and naval forces, sailed from Fort Monroe, and 29 August captured the forts guarding Hatteras Inlet, opening the way to Pamlico Sound. On the lines of the Army of the Potomac the Union forces under Col. E. D. Baker, senator from California, were defeated at Ball's Bluff, 21 October, Col. Baker being killed. On 7 November a joint expedition from Annapolis, under Gen. Thomas West Sherman and Admiral S. F. Dupont, captured Port Royal, thus securing one of the most important harbors on the Southern coast. Gen. E. O. C. Ord, with a Union brigade, defeated a brigade under J. E. B. Stuart at Dranesville, 20 December. Gen. N. P. Banks succeeded Gen. Patterson in the Shenandoah; Gen. Rosecrans commanded in West Virginia.

On 20 Nov. 1861 Gen. Quincy A. Gillmore was ordered to reconnoiter Fort Pulaski, at the mouth of the Savannah River. On 1 December he reported that it could be reduced with batteries at 1,700 yards' distance, a third greater than foreign authorities laid down as practicable

against permanent works. His batteries opened 10 April 1862, breached the walls within 24 hours, and the fort surrendered 11 April.

Gen. Robert Anderson was assigned to the Department of Kentucky 28 May. His headquarters were fixed at Cincinnati on account of the position of Kentucky in regard to neutrality, but on 1 September his headquarters were moved to Louisville. On 8 October Gen. Anderson's health failing, Gen. W. T. Sherman succeeded to the command of the Department of the Cumberland. On 9 November this Department was discontinued, and under the title of the Department of the Ohio, embracing the States of Ohio, Michigan, Indiana, and most of Kentucky and Tennessee, Gen. D. C. Buell was assigned to the command, which he assumed 15 November. Gen. Ulysses S. Grant was ordered to the District of Southeastern Missouri with headquarters at Cairo, Ill., which he reached 4 September. On the 6th he seized Paducah at the mouth of the Tennessee, and 7 November was defeated in an expedition to Belmont. Gen. J. C. Frémont was ordered to Missouri, and assumed command 25 July. Before his arrival Gen. Lyon had moved against forces under Gen. Sterling Price with which ex-Governor Jackson was seeking to regain the State, and in the battle of Wilson Creek, 10 August, where Gen. Ben McCulloch commanded, Lyon was killed and Price occupied southern Missouri. Frémont, upon assuming command, advanced against Price, and occupied Springfield. Gen. H. W. Halleck succeeded Frémont, assuming command 19 November. Gen. David Hunter then in command at Springfield withdrew under orders, leaving the Confederates in possession of southern Missouri for the rest of the year.

On the Confederate side, Gen. Joseph E. Johnston commanded the Army of Northern Virginia, "Stonewall" Jackson was in the Shenandoah, Gen. Robert E. Lee in West Virginia until November, Gen. Humphrey Marshall and Gen. G. B. Crittenden in eastern Kentucky, Gen. A. Sidney Johnston at Bowling Green, Gens. G. J. Pillow, J. B. Floyd, Simon B. Buckner, and N. B. Forrest at Fort Donelson, Gen. Leonidas Polk at Columbus, Ky., and Gen. Price in Missouri. Thus stood the opposing lines at the close of 1861. Half the year had been spent in establishing them. The campaigns of 1862 began early and were prosecuted with the greatest vigor on both sides.

From January to April Gen. H. H. Sibley, with Texas forces, was engaged in attempting to secure New Mexico to the Confederacy. He inflicted much loss on Union posts and commands under Gen. E. R. S. Canby, but abandoned his purpose the middle of April and retired to Fort Bliss.

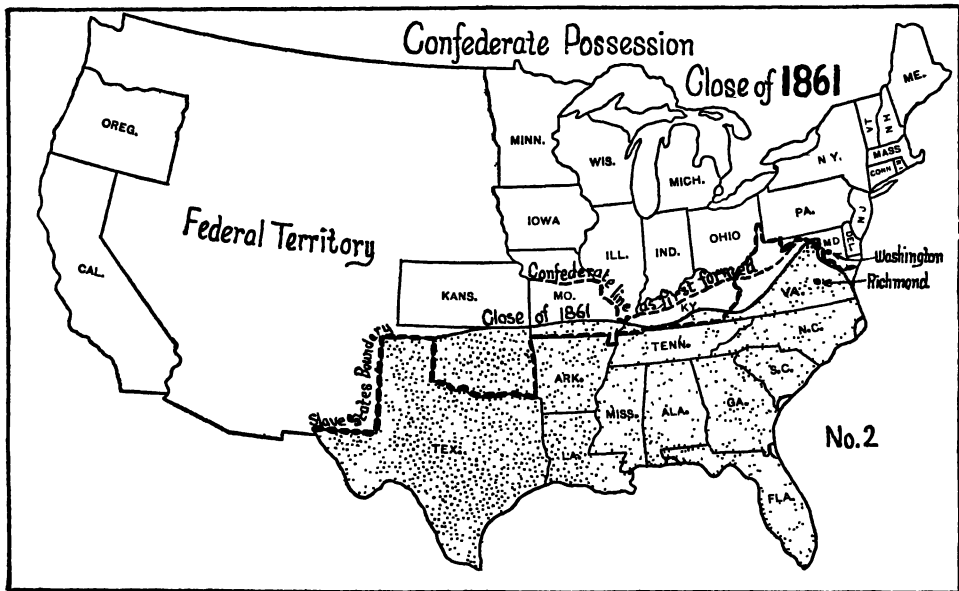

On 6-8 March a severe battle occurred at Pea Ridge, or Elkhorn Tavern, Ark., between the forces of Generals S. R. Curtis and Earl Van Dorn, resulting in the retreat of the latter.

As Gen. George H. Thomas was concentrating to attack Gen. Crittenden at Beech Grove, Ky., opposite Mill Springs on the Cumberland River, the latter marched at night from his entrenchments and attacked Thomas at Logan's cross roads the morning of 19 January. The Confederates were defeated, pursued to the river, and dispersed. This, with Gen. J. A. Garfield's movement up the Big Sandy, and his defeat of

## CIVIL WAR IN AMERICA

Humphrey Marshall at Prestonburgh, 10 January, broke the right of the Confederate line through Kentucky. On 6 February Admiral Foote's fleet, supported by Grant's forces, captured Fort Henry on the Tennessee, and Grant's army, moving at once to Fort Donelson on the Cumberland, forced its surrender on the 16th, with about 15,000 men. Gen. A. Sidney Johnston then evacuated Bowling Green 15 February, and Gen. Leonidas Polk withdrew from Columbus 3 March, the movements of the latter being hastened by Gen. John Pope's advance on New Madrid and Island No. 10. This latter was captured 7 April. The Confederate forces in Kentucky and Tennessee then withdrew to the line of the Memphis & Charleston R.R., Gen. Johnston establishing his headquarters at Corinth. Gen. Buell, moving rapidly from Kentucky, occupied Nashville, 25 November. Gen. Johnston, learning that Buell was to join Grant, whose army had been brought from Fort Donelson to Pittsburg Landing, and was

found that the Confederates had already evacuated the place. After a short pursuit, under Pope and Buell, as far as Blackland, the Union army was concentrated at Corinth, and extensive fortifications were erected. The army was soon divided, and Buell with the Army of the Ohio was sent toward Chattanooga, with orders to repair the railroad as he advanced. Gen. Braxton Bragg, who had succeeded Beauregard, proceeding to Chattanooga by way of Mobile and moving rapidly north behind the Cumberland, compelled Buell to withdraw to the Ohio River to protect his department, which included Indiana, Ohio, and Michigan. Gen. E. Kirby Smith, at the same time, invaded Kentucky by way of Cumberland Gap, defeated Union forces at Richmond, 30 August, and threatened Cincinnati. Buell, upon reaching Louisville, advanced upon Bragg. On 8 October resulted the battle of Perryville, by which Bragg was compelled to abandon Kentucky. Passing through Cumberland Gap, he retired to Chattanooga,

camped there awaiting Buell, marched from Corinth to attack Grant before the junction could take place. The Union army was unexpectedly attacked 6 April at Shiloh Church, two miles and a half in front of Pittsburg Landing and forced back to the immediate vicinity of the landing. The advance of Buell arrived about sundown, and during the night four divisions, three of Buell's army and Lew Wallace's of Grant's, reached the field. The next day the Confederates under Gen. Beauregard, being largely outnumbered, were defeated and returned to Corinth. Gen. A. Sidney Johnston was killed near the close of the first day's fight.

Gen. Halleck arrived from St. Louis 11 April and took command. Gen. Pope's army was brought from Island No. 10. On 30 April an advance began on Corinth by slow approaches. The Confederates brought Price and Van Dorn from west of the Mississippi. On 30 May Gen. Halleck's lines were close to the city, and an attack was meditated, when it was

whence he advanced to Murfreesboro in central Tennessee, and went into winter quarters.

During the operations at Pittsburg Landing and Corinth Gen. O. M. Mitchell advanced with a division from Murfreesboro 5 April, reached Huntsville 11 April, and seized the Memphis & Charleston R.R. from Decatur to Bridgeport. Gen. J. S. Negley's brigade crossed the mountains and bombarded Chattanooga 7 June. Mitchell's operations drew Gen. E. Kirby Smith from east Tennessee, and left the way open for Gen. G. W. Morgan at Cumberland Ford, Ky., to seize Cumberland Gap.

In September Price and Van Dorn, who had previously joined Beauregard from beyond the Mississippi, moved against Grant and Rosecrans in the region of Corinth. Price was defeated by Rosecrans 19 September, at Iuka, and Van Dorn, supported by Price, 4 October, at Corinth. From this campaign Rosecrans was sent to relieve Buell in command of the Army of the Cumberland, then styled the Fourteenth

## CIVIL WAR IN AMERICA

corps. On 30 October Gen. Rosecrans relieved Gen. Buell, and concentrated his army at Nashville. On 26 December he moved toward Murfreesboro to attack Bragg. The battle began on the last day of the year, and continued during the days of 1-2 Jan. 1863. Gen. Bragg retreated the night of 3 January, eventually taking up positions at Shelbyville, Tullahoma and Wartrace. Gen. Rosecrans occupied Murfreesboro. The respective armies remained on these lines until Rosecrans' advance in June 1863.

While Rosecrans was succeeding at Murfreesboro, there was a noted Confederate victory at Galveston. Gen. Magruder, with a fleet of ordinary river boats, protected with hay and cotton bales, captured the Harriet Lane 1 January, sunk the gunboat Westfield, and received the surrender of the forces holding the city. The Confederate Alabama, arriving shortly after, captured the gunboat Hatteras.

Both river fleets of armored and unarmored gunboats, mortar-boats, and rams were actively engaged on the western rivers. The Union fleet, Commodore A. H. Foote, was composed of 45 vessels of various classes, and 38 mortar-boats. The Confederate fleet, Commodore Montgomery, was somewhat less, but contained several formidable vessels. Commodore Foote's gunboats captured Fort Henry on the Tennessee, and played an important part at Fort Donelson, Pittsburg Landing, and New Madrid. Commodore Montgomery awaited Foote's fleet, now under the command of Commodore C. H. Davis, before Memphis. The Union fleet was made up of 5 gunboats with 68 guns, and 4 rams; the Confederates of 8 gunboats with 28 guns. After a desperate battle, 6 June, against great odds, the Confederate flotilla was destroyed, and Memphis surrendered to the fleet. Davis left Memphis 29 June, and 1 July reached Young's Point, where he joined Admiral David G. Farragut's fleet from New Orleans, which had run the Vicksburg batteries.

The year 1862 opened at the east with very general dissatisfaction over the long inaction of Gen. McClellan. Gen. Joseph E. Johnston was at Manassas and Centreville with some 50,000 men, but Gen. McClellan, misled by his secret service, continually insisted that there were three times that number. The Army of the Potomac numbered fully 150,000 present for duty. The Potomac was blockaded, and the Confederate flag floated on Munson's Hill in sight of Washington. On 31 January President Lincoln gave McClellan a peremptory order to move on Manassas not later than 22 February. McClellan asked leave to present a plan of his own for a movement down the Potomac, up the Rappahannock, across to York, and thence to Richmond. While he was discussing it, Johnston, placing "Quaker guns" in his embrasures at Centreville, withdrew unmolested behind the Rappahannock to a line of works and field depot already prepared.

Just as his movement began occurred the ominous attack, 8 March, of the Confederate ironclad Merrimac, Flag Officer Franklin Buchanan, which suddenly moved out from Norfolk and attacked the Union fleet in Hampton Roads, sinking the frigate Cumberland, capturing and destroying the frigate Congress, doing much other damage, and startling the entire eastern coast. On resuming operations the next

day the Merrimac was met and foiled by the Monitor, Lieut. John L. Worden, which had just arrived. The Merrimac then retired to Norfolk, being blown up when the Confederates evacuated that city, 9 May.

McClellan was allowed to undertake his Peninsula campaign. On 11 March he was relieved from the general command of the armies. The Army of the Potomac was transported to Fort Monroe, and the movement up the peninsula toward Yorktown began 4 April. Heavy rains caused delays from the start. It was found at Washington that the designated number of men had not been left for the proper defense of the capital. McDowell's corps was therefore retained. Arriving before Yorktown with about three times the strength of the enemy, he concluded to lay regular siege to the position. Parallels were therefore opened, nearly 100 heavy siege guns were brought up, and at the end of a month, as his batteries were about to open, Gen. J. E. Johnston evacuated the place 3 May and withdrew toward Richmond. He halted at Williamsburg, where on the 5th an unsupported attack was made upon his lines, and at night he withdrew toward Richmond. McClellan followed to the Chickahominy. On 15 May the Union fleet in the James made an unsuccessful attack on Drewry's Bluff, eight miles below Richmond. On 20 May the right of his army crossed the Chickahominy and advanced to Seven Pines, or Fair Oaks, about five miles from Richmond, where he was attacked by Gen. Johnston 31 May. The prompt advance of Sumner's corps from the other side of the Chickahominy prevented serious disaster. At the close of the day Gen. Johnston was badly wounded and carried from the field. Gen. Gustavus W. Smith commanded temporarily, and was succeeded 2 June by Gen. Robert E. Lee, who continued in command of the Army of Northern Virginia until Appomattox. On 1 June the battle was renewed by the Confederates, the troops regained their lost ground, and Lee withdrew to the fortifications of Richmond.

On 16 June the Union forces on James Island in Charleston harbor, under Gen. Benham, met with a severe repulse at Secessionville. Gen. "Stonewall" Jackson, by a brilliant campaign in the Valley, had prevented the most of McDowell's corps, then in the vicinity of Fredericksburg, from reinforcing McClellan. By moving rapidly down the Valley he defeated Banks at Winchester and forced him across the Potomac, 26 May. Returning, he defeated Gen. J. C. Frémont at Cross Keys, 8 June, on one flank, and Gen. James Shields at Fort Republic, 9 June, on the other, and after a week spent in deceiving Gen. Frémont into the belief that he was about to advance down the valley, by a rapid and unsuspected movement he appeared 25 June at Ashland on the flank of McClellan's army in front of Richmond. Then followed the Seven Days' battles, beginning with Mechanicsville 26 June, and ending at Malvern Hill 2 July, whence the Army of the Potomac withdrew to Harrison's Landing on the James. The only victories of the series were the first and last battles. The Peninsula campaign had ended as a disastrous failure. Gen. McClellan had been relieved from the command of all the armies 11 March, retaining that of the Army of

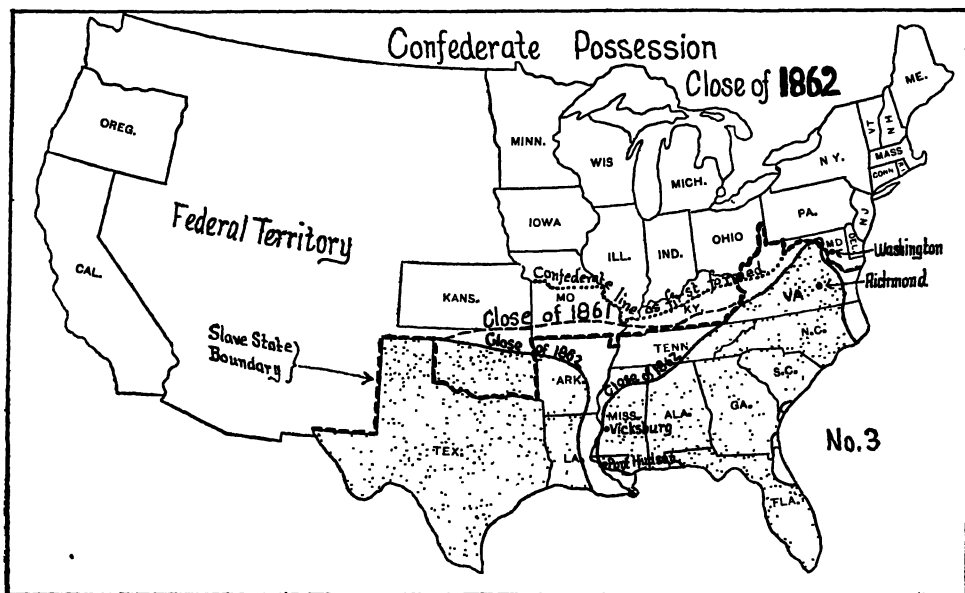

## CIVIL WAR IN AMERICA

the Potomac, and Halleck assumed the chief command 23 July.

Against McClellan's protest, it was decided to withdraw his army from the Peninsula to the vicinity of Washington. To cover this movement, and protect Washington, Gen. John Pope was given command of the Army of Virginia, organized with the corps of McDowell, Banks, and Frémont. Pope concentrated his army north of Culpeper, and began with his cavalry to operate toward Lee's railroad communications at Gordonsville. Lee, though McClellan's army was still within striking distance of Richmond, at once sent a portion of Jackson's and Gen. James Longstreet's corps to Gordonsville. Pope took the field 29 July, and threatened Gordonsville again. "Stonewall" Jackson advanced on the 7th, reaching Cedar Mountain on the 9th. Here Banks attacked and was defeated. Jackson retired beyond the Rapidan, and upon Lee, with Longstreet, coming up, Pope retired behind the Rappahannock. By a long

battle of Chantilly. Pope then, under orders, 2 September, withdrew his army to the fortifications of Washington.

Pope was then relieved; his forces were added to the Army of the Potomac, and McClellan took command of the combined army. The first Confederate invasion of the North followed. On 3 September Lee put his army in motion from Chantilly toward the Potomac. The crossing was accomplished in the vicinity of Leesburg on the 5th, the army moving forward to Frederick, where, on the 7th, Lee issued a proclamation setting forth that his army had come to help them regain the rights of which they had been despoiled. This was coldly received. Upon learning that the garrison of Harper's Ferry had not withdrawn, he detached forces which invested and captured that place with its garrison of 11,000 men and over 70 guns. Lee, who, with Longstreet's command, had marched to Hagerstown, turned back to hold Turner's Gap in South Mountain, but was

detour, by way of Salem and Thoroughfare Gap, Jackson, moved rapidly around Pope's right and 26 July destroyed his stores at Bristoe Station and Manassas in his rear, retiring to the former battlefield of Bull Run. On the 23d Reynolds' division from the Army of the Potomac joined McDowell, and on the 25th Gen. S. P. Heintzelman's corps, two divisions, arrived, and the next day Fitz-John Porter's corps of two divisions reached Pope. The battle of Gainesville followed on the 28th, resulting in the retirement of two of McDowell's divisions. At Groveton on the 29th the head of Longstreet's forces reached the field and took part in the closing fight. All the battles of the campaign had been desperately fought by both sides. On the 30th occurred the second battle of Bull Run. Pope was defeated, but withdrew unmolested to Centreville beyond Bull Run. Here he was joined by the strong corps of Sumner and Franklin from McClellan's army. A flank movement by Jackson led to the

defeated on the 14th and fell back to Sharpsburg, where he was subsequently joined by the forces detached against Harper's Ferry.

McClellan advanced from Washington 5 September toward Frederick, Md., the right wing and centre passing through that place on the 13th, the right moving to Turner's and the left to Crampton's Gap. Both these positions were carried on the 14th after sharp fighting. On the 15th Lee took position on the high ground beyond Antietam Creek, and in front of Sharpsburg. Gen. Joseph Hooker's corps attacked his left toward evening of the 16th, the fighting continuing until after dark. The general engagement began at daylight on the 17th, lasting for 14 hours, the losses being greater than for any one day's fighting of the War. The advantages were with the Union army, though Lee maintained his lines during the 18th, but at night withdrew and crossed the Potomac, ending the first invasion of the North. Lee remained a month about Winches-

## CIVIL WAR IN AMERICA

ter, and upon the Union Army's crossing into Virginia and moving toward Winchester he took position behind the Rappahannock.

Near Warrenton, 7 November, McClellan was superseded by Gen. Ambrose E. Burnside, under an order dated 5 November. The latter took position opposite Fredericksburg 19 November, and, 13 December, forced a crossing into the city and below it. After great slaughter, largely incurred in assaults on Marye's Heights, he was repulsed and obliged to recross the river. The next month he attempted to cross above Fredericksburg and turn Lee's left. An unusual storm made advance impossible, the army finding itself actually stalled, the movement becoming known as the great Mud March. After this failure Burnside was relieved by Hooker 26 Jan. 1863.

The navy was active and effective throughout 1862. The blockade became exceedingly stringent for the Confederacy; warlike and commercial supplies alike were very difficult to obtain. On 11 January Gen. Burnside and Commodore L. M. Goldsborough sailed from Fort Monroe, capturing Roanoke Island 5 February, Newbern, 14 March, and taking Fort Macon with its garrison 26 April.

Gen. Butler and Admiral Farragut sailed from Fort Monroe 25 February for a move against New Orleans. After a terrific engagement, participated in by Commander D. D. Porter with his mortar-boats, and in which the Confederates exhibited great endurance, the chain across the river below forts St. Philip and Jackson was cut, and 24 April Farragut forced his fleet past the forts, and after terrific fighting, during which the Varuna was sunk by the fire of the forts, appeared before New Orleans on the 25th. Gen. Lovell, who held the city with a small force, some 3,000, retiring. Gen. Butler arrived with his troops 1 May, and took full possession, taking Baton Rouge 9 May, and Natchez on the 13th, neither being fortified. Farragut's fleet then ascended the Mississippi. He ran past the batteries at Vicksburg and joined Commodore Foote's (Davis') fleet from Memphis at Young's Point. Retiring to New Orleans, thus running the Vicksburg batteries a second time, he found letters from Washington urging him to clear the Mississippi. On 25 June his fleet, with Porter's mortar fleet, was assembled at Vicksburg, and on the 28th, after a short engagement, two ships and five gunboats ran the batteries and again joined Davis' fleet above the city. On 15 July the Confederate ironclad Arkansas came out of the Yazoo, ran directly through the Union fleet, none of its vessels having steam up, and gained the shelter of the Vicksburg batteries. Farragut ran the batteries that night, and attempted to destroy the Arkansas while passing the city wharves, but failed. On 20 July his fleet was ordered to New Orleans, where it arrived on the 29th.

Grant, from Corinth, 1 November, began his first move against Vicksburg, by ordering his troops forward to Grand Junction, purposing to move along the railroad by way of Holly Springs and Grenada to the rear of the city, while Sherman should co-operate from Memphis. A raid by Forrest destroyed long reaches of railroad above Jackson, and the destruction of the depot of supplies with its immense stores at Holly Springs, 20 December, by Van Dorn,

effectually paralyzed Grant's advance toward Vicksburg.

During Forrest's and Van Dorn's operations east of the Mississippi Gen. T. C. Hindman, in Arkansas, attacked Gens. F. J. Herron and J. G. Blunt at Prairie Grove, but retreated after a severe engagement. On 16 December Gen. N. P. Banks relieved Gen. Butler at New Orleans.

Sherman was then sent, 20 December, from Memphis down the Mississippi to ascend the Yazoo and attempt the capture of the left flank of the defenses of the city at Haines' Bluff. He assaulted at Chickasaw Bayou, 29 December, with disastrous results, and returned to the mouth of the Yazoo, where he was met by Gen. J. A. McClernand with orders to assume general command. This officer at once moved up the Arkansas River with Porter's gunboat fleet and Sherman's and G. W. Morgan's corps, captured Fort Hindman 11 January, and returned to Young's Point. From this position the Vicksburg campaign of 1863 began, which opened the Union operations of that year.

The first attempt was to cut a canal across the peninsula opposite Vicksburg, which would allow the army to move below Vicksburg. After working on this from 22 January to 7 March, a flood destroyed it. Efforts were next made to open a way through Lake Providence to the Red River, making a circuit of 350 miles to a point below the city. Both this plan and one for the east side through the Yazoo pass leading to the rear of the city, being actively opposed by the Confederates, and found otherwise exceedingly difficult, were abandoned.

A way was finally found from Milliken's Bend by way of New Carthage to a point on the river opposite Bruinsburg. On the night of 16 April the memorable running of the Vicksburg batteries by the fleet of Admiral Porter, conveying transports, was successfully accomplished. The means of ferrying his forces over the Mississippi being thus secured, the advance of the army crossed 30 April. Port Gibson was captured 1 May, after a stubborn and most gallant defense against a greatly superior force by Gens. Bowen, Baldwin, and Cockrell. Grant was then on solid ground in rear of Vicksburg.

He moved at once to intervene between Pemberton at Vicksburg and Johnston, who was seeking a junction with Pemberton. Johnston was forced out of Jackson by Sherman's and Gen. James B. McPherson's troops 14 May. Grant then turned toward Pemberton, advancing from Vicksburg, defeated him at Champion's Hill on the 16th, again at Big Black Bridge on the 18th, whence Pemberton withdrew into Vicksburg, followed by Grant. On the 19th Grant ordered an assault, which was repulsed, and again on the 22d, with the same result. A regular siege was then undertaken, and Pemberton's army was starved out and surrendered 4 July.

On 24 May 1863, Gen. J. M. Schofield, who had been active and prominent in Missouri from the first, relieved Gen. Curtis in command of the Department of the Missouri. During the Vicksburg campaign he sent all troops that could be spared to Grant. Upon their return he was able to advance Gen. Steele to the line of the Arkansas and hold it thereafter. During 8-14 June Grant received a division from Gen. S. A. Hurlbut's command, under Gen. Sooy

## CIVIL WAR IN AMERICA

Smith, one from the Department of the Missouri, under Gen. Herron, and two divisions of the Ninth corps under Gen. J. G. Parke. During the operations of Gen. Grant about Vicksburg Gen. Banks was active in Louisiana. After three unsuccessful attempts against Port Hudson, which he twice assaulted, it finally surrendered, 8 July, upon hearing of the capture of Vicksburg.

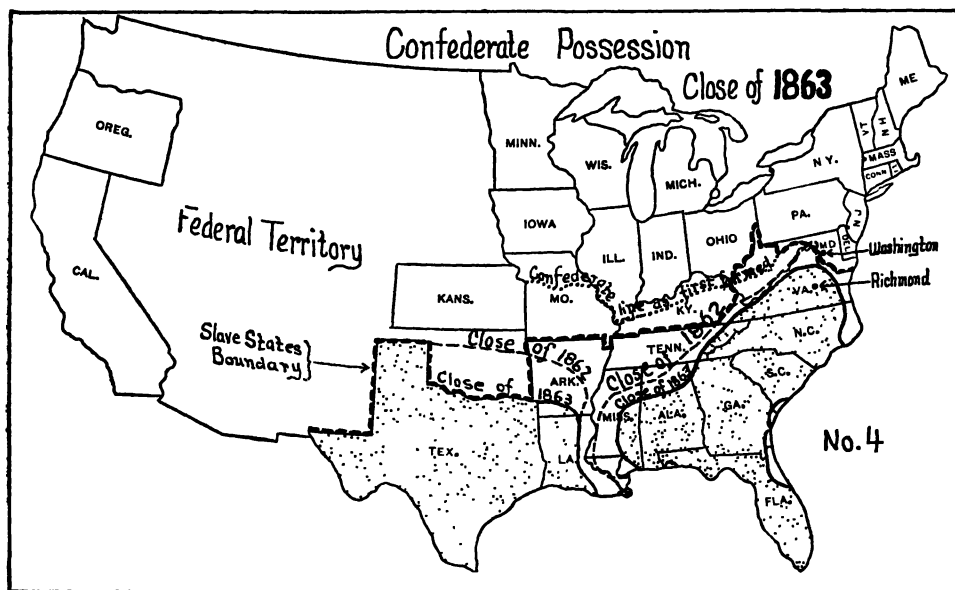

In January, February, and March 1863, the Union ironclads under Admiral Dupont made unsuccessful attacks upon Fort McAllister in the Ogeechee River, but in one of them destroyed the noted blockade-runner Nashville. The Confederates were active on the North Carolina coast early in 1863, Gen. Hoke capturing Plymouth 20 April.

The campaign of the year in the Army of the Potomac was opened by Hooker. On 28 April Gen. John Sedgwick's corps was thrown across the Rappahannock at Fredericksburg, the rest of his army crossing above at Kelly's

forced further to the rear. The 4th passed without an engagement, as Lee, with the greater part of his army, was at Salem Church. The night of the 5th Hooker, thoroughly defeated, recrossed the river, and his army was reassembled at Falmouth.

On 3 June Lee, from Fredericksburg, began his second invasion of the North, Longstreet's troops leading. After minor engagements in the Valley, Gen. R. S. Ewell's advance crossed the Potomac at Williamsport 15-16 June, moved forward to Chambersburg, and had reached the vicinity of Harrisburg and Columbia on the Susquehanna, and captured York 28 June, when recalled to Gettysburg, where Lee's army was concentrating.

Meantime, the Army of the Potomac under Hooker reached the vicinity of Frederick, when Hooker, not being allowed to order the garrison of Harper's Ferry, over 10,000 strong, to join him, asked to be relieved, and Gen. George G. Meade succeeded him. The two armies met

ford, and thence advancing across the Rapidan at Germanna and Ely's fords, to and beyond Chancellorsville. His force was fully twice that of Lee. On 1 May Hooker's advance fell back to Chancellorsville. On 2 May "Stonewall" Jackson's corps of three divisions was described at different times during the day from several points of the Union line moving toward its right. No preparations were made to guard against a flank attack, though orders to that effect were early given. At 6 p.m., while the troops of the Eleventh corps holding the right were at supper, Jackson's solid columns burst upon them and disastrously routed the Union right. On the 3d Sedgwick's corps advanced from Fredericksburg to Salem Church, was defeated that afternoon, and recrossed the river on the night of the 4th. The night of the 2d Jackson, reconnoitering in front of his pickets, was mistakenly fired on by them and mortally wounded. On the 3d, by hot fighting, Hooker's lines were

at Gettysburg 1 July. A three days' battle followed. Lee retreated the night of the 3d, but succeeded in recrossing the Potomac without a battle, and after a month's rest in the Shenandoah, resumed his former lines behind the Rappahannock. (See GETTYSBURG, BATTLE OF.) Meade followed later to that stream. With the exception of the Mine Run campaign, 26 November to 2 December, inaugurated by Gen. Meade, but without important results, both armies remained in their camps until the spring of 1864.

The campaign of the Army of the Cumberland for 1863 began 23 June, the objective being the recovery of middle Tennessee. The Union army under Rosecrans held the line of Stone's River, headquarters at Murfreesboro; the Confederates under Gen. Bragg, the general line of Duck River, with headquarters at Tullahoma. By feinting against Bragg's left at Shelbyville and turning his right, both flanks being established in entrenched camps, Bragg was

## CIVIL WAR IN AMERICA

forced out of his lines and retreated over the Cumberlands and across the Tennessee to Chattanooga. It was chiefly a strategic campaign, carried on in continuous rains of most unusual severity, occupying nine days, and involving a total loss of only 560 killed, wounded and missing. The Union line advanced to the western base of the Cumberland Mountains.

The succeeding campaign, having Chattanooga for its objective, required extensive repairs to the railroad and an accumulation of supplies sufficient for leaving a base for a month, and moving in a mountainous region largely barren. The movement began 16 August. Bragg was at Chattanooga. Rosecrans' army lay along the western base of the Cumberlands from Winchester to McMinnville. Rosecrans feinted with his left corps, Gen. T. L. Crittenden's, by throwing it from McMinnville over the mountains, its advance being into the valley of the Tennessee above Chattanooga. This led to the belief that a junction was to be formed with Burnside from Knoxville, or an attack made upon the city from that quarter. Bragg, as a result, fixed his attention upon this move. Meantime the centre corps, Thomas', and the right, Gen. A. McD. McCook's, crossed the Cumberlands and the Tennessee River some 30 miles below Chattanooga, continued over the Sand Mountains, and ascended the Lookout range—all bold mountains with palisaded summits crossed only by very difficult and widely separated mountain trails. When Rosecrans' columns were ascertained to be on Lookout, Bragg, 7 and 8 September, withdrew from Chattanooga, the heads of the Union columns having in the meantime descended into McLemore's Cove, south of Chattanooga. Upon Bragg's reaching Lafayette, 26 miles south of Chattanooga, he awaited Longstreet's arrival from Virginia, meantime unsuccessfully demonstrating against Rosecrans' centre and left east of Lookout in the valley of the Chickamauga. Crittenden's corps, after having accomplished its diversion, had crossed the Tennessee, left one brigade in Chattanooga, 9 September, and moved south through Rossville to a position on Rosecrans' left at Lee and Gordon's Mill on the Chickamauga. Bragg, strengthened by Longstreet, started back 17 September toward Chattanooga, seeking to interpose between Rosecrans and that city. Rosecrans, by a night march, 18 September, proceeded toward Chattanooga, formed his lines between Bragg and the city, nine miles south of it, at Chickamauga. A two days' battle, 19 and 20 September, ensued for the possession of the roads to Chattanooga. At noon of the second day Longstreet broke through a gap at the centre of the Union lines, cut off two divisions of the right wing, and forced them with fragments of other divisions from the field, Rosecrans, McCook, and Crittenden being caught in the break. Gen. Thomas, with the greater part of seven divisions, held the field, and at night withdrew to Rossville and there reformed the army between Bragg and the city, thus securing its possession without further fighting. Bragg advanced on the 22d, and formed his lines in front of the city, which Rosecrans soon rendered impregnable by heavy earthworks. Bragg's lines embraced Lookout Mountain and Missionary Ridge, heights overlooking the city, the mountain position closing the river line of supplies. The sit-

uation of the Union army soon became precarious for want of food and forage. Hooker, with the Eleventh and Twelfth corps was ordered from the Army of the Potomac, reaching Bridgeport 30 September; and Sherman, with four divisions from the vicinity of Vicksburg. Grant was assigned to general command, arriving 23 October. Rosecrans was replaced by Gen. George H. Thomas 19 October. The river line of supplies was opened 28 October upon a plan devised by Gen. Rosecrans and executed by Gen. W. F. Smith. Hooker being brought forward to Lookout Valley, and troops from Chattanooga forming a junction with him. The battle of Chattanooga occupied three days. On 23 November Thomas, in the centre, threw forward one division, supported by four, and captured the advanced line of Bragg. The night of the 23d Sherman crossed the river six miles above the city and seized an unoccupied range overlooking the north end of Missionary Ridge. On 24 November Hooker carried the western and northern slopes of Lookout Mountain, and the next day moved against the south end of Missionary Ridge. The afternoon of 25 November Thomas, at the centre, assaulted Missionary Ridge, his storming line being two and a half miles front, carried the earthworks at the foot of the ridge, and next the ridge itself, capturing 37 guns on the summit, and forcing a general retreat. From this time Chattanooga remained in Union control to the close of the war. (See CHATTANOOGA, BATTLE OF; CHICKAMAUGA, BATTLE OF.)

The same day that Rosecrans started from Winchester, Tenn., for Chattanooga, Burnside with the Army of the Ohio (Twenty-third corps) left Lexington, Ky., for Knoxville, Tenn., his Ninth corps being still with Grant near Vicksburg. He reached Knoxville 2 September. Being ordered to assist Rosecrans at Chattanooga, he was held by demonstrations of a small force from making the junction. On 4 November Bragg despatched Longstreet's corps from Chattanooga to besiege Knoxville. On the 29th he assaulted Fort Saunders and was repulsed with serious loss. Sherman, who was sent by Grant from Chattanooga after the success there, now approaching, Longstreet retreated to Virginia. On 16 December Burnside was relieved and ordered to recruit the Ninth corps, which was assembled at Annapolis.

Throughout these operations both Union and Confederate forces in Charleston harbor had been engaged in formidable attack and most stubborn and brilliant defense. Gen. Gillmore, who had reached Charleston 12 June, immediately undertook engineering and siege work of unprecedented character as to success at long ranges; and finally, after several severe repulses, forced the evacuation of Fort Wagner 7 September, and soon shells reached the city from his long-range guns. While some of these fell in Charleston 31 August, the regular bombardment began 16 November.

On 28 Jan. 1864, Gen. Rosecrans was ordered to relieve Gen. John M. Schofield in Missouri, the latter being assigned a little later to the command of the Department and Army of the Ohio at Knoxville. Gen. Rosecrans repulsed the invasion of Gen. Price, and then sent troops not needed to Gen. Thomas at Nashville. On 20 February an expedition sent from Charleston to Florida by Gen. Gillmore under

## CIVIL WAR IN AMERICA

Gen. Seymour, was disastrously defeated by Gen. Finegan at Olustee. From February to December 1864, Gen. Forrest was active throughout west Tennessee and northern Mississippi and Alabama, performing much brilliant cavalry service, to the continued disturbance of all Union commands in those regions.

Early in the spring of 1864 Banks, supported by Admiral Porter's fleet, was ordered to advance up the Red River. At Sabine Cross-roads 8 April, he was defeated and driven back to Pleasant Grove, and thence to Pleasant Hill 13 April, where A. J. Smith, from Sherman's army, re-enforced him. The fleet narrowly escaped capture by the falling of the river, and altogether the campaign was a decided failure. The defeat of Banks enabled the Confederate general, J. F. Fagan, to force Gen. Frederick Steele, who was advancing to co-operate with Banks, back to Little Rock. Banks was relieved 12 May by Gen. E. R. S. Canby.

On 12 March 1864, Gen. Grant, who had

mond by Lee's right. Sherman, with three armies, the Cumberland, under George H. Thomas, the Tennessee, under McPherson, and the Ohio, under Schofield, aggregating nearly 100,000 men, was to move against Johnston's army at Dalton and follow it. Banks was to leave the Red River country to Steele and the navy, abandon Texas, and move against Mobile with his 25,000 men, re-enforced by 5,000 from Missouri.

Grant established his headquarters with the Army of the Potomac, Meade having the full direction of the army under Grant's general orders. The Army of the Potomac moved toward the Rapidan in the early morning of 4 May, and by night all the troops had crossed.

Grant's force was about 119,000, and Lee's about 62,000. Lee pushed rapidly to his right and struck Grant's advance in the Wilderness 5 May. Terrific fighting followed till the night of the 6th. Lee pushed on to Spottsylvania, reaching it in advance of Grant and interposing on the

been commissioned lieutenant-general, that grade having been revived by Congress, was placed in command of all the armies. Early in April he had formed a plan for a combined movement of the armies to begin toward the last of the month, and had communicated the same to Meade with the Army of the Potomac, Butler at Fort Monroe, Sherman at Chattanooga, and Banks at New Orleans. The main Confederate armies were those of Lee, at Orange, with Longstreet at Gordonsville, confronting Meade in the vicinity of Culpeper, and Johnston at Dalton, Ga., facing Sherman in the vicinity of Chattanooga.

Grant's general plan was for Gillmore, from South Carolina, with 10,000 men, to join Butler at Fort Monroe, giving him 23,000 troops for a move up the James to capture City Point, threatening Petersburg and the rear of Richmond. Burnside, with 25,000 men assembling at Annapolis, was to join Meade, and the Army of the Potomac was to advance toward Rich-

mond. Both armies entrenched, and from the 8th there was bitter fighting until the night of the 20th, when Grant started for North Anna. From Spottsylvania 8 May, Sheridan, commanding Grant's cavalry, made a raid around Lee's army, encountering and defeating J. E. B. Stuart at Yellow Tavern 11 May, where Stuart was killed. Sheridan spent a day within the outer defenses of Richmond, and joined Butler on the James. Grant proceeded to move to his left, everywhere opposed by Lee, fighting heavily at North Anna and Bethesda Church, reaching Cold Harbor 2 June. On the 3d Grant assaulted along his whole line, to meet in an hour with terrible slaughter and repulse, so serious that an order for a second assault was not carried out. Grant had failed to interpose between Lee and Richmond. From Cold Harbor he sent Sheridan with his cavalry to occupy the attention of Fitzhugh Lee's and Hampton's cavalry while he withdrew to the James. Sheridan defeated both at Trevilian's Station. Grant

## CIVIL WAR IN AMERICA

then moved without interruption to the James, reaching it 13 June, and crossing it in the vicinity of City Point and Bermuda Hundred. Gen. Butler had occupied these points 5 May. On the 14th Butler carried the outer defenses of Drewry's Bluff, but was thence driven back by Beauregard's troops, who had arrived from the south, and his contemplated movement toward Petersburg and the rear of Richmond was defeated. Lee occupied the Petersburg lines. Grant attacked the works several times unsuccessfully from 15 to 18 June. On 30 July an attempt on the works was made by exploding a mine. The explosion was a great success, but the assault to follow it was a failure. This was the battle of The Crater.

From the establishment of Grant's lines before Petersburg frequent and heavy fighting continued until about 1 November, but with little permanent impression on Gen. Lee's lines. The Union left, however, was extended across the Weldon R.R. On 28 September Gen. Butler, with two corps, crossed to the north side of the James and captured Fort Harrison, a position from which Richmond was seriously threatened. On 16 November Butler, supported by Porter's fleet, was sent to capture Fort Fisher, but failed. During the winter the lines of each army were greatly strengthened. On 7 December Grant had extended his left 20 miles to Hicksford on the Weldon R.R. On 22 June Gen. James H. Wilson, with two divisions of cavalry, moved against the railroads south of Richmond, destroying nearly 50 miles of track, and inflicting much other serious damage. His return route was blocked, but he brought his forces in with some loss of both artillery and trams. He had severed all railroad connections with Richmond, and they were not fully restored for several weeks. Gen. Franz Sigel's campaign began 1 May. On the 15th he moved up the Shenandoah to New Market, and was defeated, cadets from the Virginia Military Institute taking prominent part. At Grant's request Sigel was suspended and Gen. David Hunter assigned. The latter pushed on to Lynchburg, but was compelled by Gen. Jubal A. Early to retreat from that point by way of the Kanawha and Ohio rivers to Parkersburg, and thence by rail to the east. Gen. George Crook's wing of Sigel's column from the Kanawha penetrated to the Tennessee and Virginia R.R. at Wytheville.

On 6 May Gen. Sherman moved from the vicinity of Chattanooga against Gen. Johnston at Dalton. The Union army had in round numbers 100,000, the Confederates being about half as strong. After vainly attacking the gaps and ranges in front of Dalton for several days, Sherman passed his army through Snake Creek Gap leading to the rear of Dalton. This compelled Gen. Johnston to retire from his camps, and he was defeated at Resaca. Johnston resisted stubbornly at every step, but he was successively flanked out of every new position until he reached Atlanta. Fighting had been in progress at some points of the line from May till September. Johnston was succeeded by Hood 18 July, and on the 20th Hood attacked at Peach Tree Creek, and was repulsed with great loss. He then moved out of Atlanta and attacked, and was again defeated. Gen. McPherson, commanding the Army of the Tennessee, was killed. The next attack was at Ezra

Church 28 July, upon the Army of the Tennessee, this also being repulsed after three hours' severe fighting, with much loss.

On 2 September Sherman occupied Atlanta, which was evacuated as a result of his moving to the rear of the city on Jonesborough. Hood first raided Sherman's railroad communications, fighting heavily at Allatoona 5 October, and soon after moved northward. Gen. Thomas was sent to resist his movement if he invaded Tennessee, and Sherman started 15 November on his March to the Sea. While it was originally intended by Gen. Grant that he should move from Atlanta to Mobile, the harbor there having been captured 5-23 August by Farragut and Canby, he decided upon the alternative which Grant had suggested before the campaign opened, and started for Savannah.

The fight of Farragut's fleet in the harbor of Mobile, which decided Sherman's march to Savannah, was one of the most brilliant in naval warfare. The Confederate fleet was destroyed, including the far-famed ironclad ram Tennessee. Sherman reached Savannah with slight opposition. On 17 December he summoned Hardee to surrender. The latter refused, and on the night of the 20th retired with his force of 10,000 without molestation. The next morning the Union army entered.

Meantime Hood had invaded Tennessee with the entire army with which Sherman's three armies had been confronted from May till September. Gen. Thomas left with two small but excellent corps, by great exertion organized an army to oppose Hood. On 30 November Gen. Schofield, commanding in the field in front of Hood, inflicted a nearly fatal blow upon him at Franklin. After Gen. Thomas' forces were united at Nashville 15-16 December, he attacked Hood's entrenchments in front of the city and dispersed and practically annihilated his army.

The forced retreat of Hunter from Lynchburg over the mountains of West Virginia left the Shenandoah unprotected. Gen. Early entered it, drove Sigel across the Potomac, then on 9 July defeated Wallace, who was in small force at Monocacy, Md., threatened Baltimore and appeared before Washington 11 July. Here he was met by veterans of the Sixth and Nineteenth corps, Army of the Potomac, hurried to Washington by Grant, and forced into rapid retreat. Upon the withdrawal of the troops from the Army of the Potomac Early again sent a force under Gen. John McCausland, into Pennsylvania, and these invaders burned Chambersburg 30 July. Sheridan, being assigned to command, forced Early beyond Staunton; and devastating the Valley, he withdrew to Cedar Creek. While Sheridan was absent Early attacked and drove the army out of its camps. Gen. H. G. Wright, however, rallied the troops near Middletown and restored the battle. Sheridan arriving, the army advanced, and Early was so seriously defeated as to close the campaign in the Valley.

The first movement of the final campaigns of 1865 began 2 January in Tennessee, when Gen. Schofield with the Twenty-third corps left Columbia, Tenn., for Clifton on the river bound for the east. The corps left Alexandria on transports soon after 1 February, and landed at the mouth of Cape Fear River 9 February,

## CIVIL WAR IN AMERICA

where the Tenth corps was established, which, under Gen. Alfred H. Terry, had captured Fort Fisher, that had been most stubbornly and gallantly defended against the army and the fleet by Gen. W. H. C. Whiting. Fort Anderson was attacked by army and fleet, and abandoned 19 February; the position of Town Creek was carried 20 February, and Wilmington was taken 22 February. Operating next by way of Newbern, Gen. R. F. Hoke was defeated at Kingston 10 March. Goldsboro was occupied by Gen. Schofield on the 21st. Sherman's army joined Schofield here on the 23d. On 26 January Gen. Terry had been despatched to co-operate with Admiral Porter in reducing Fort Fisher at the mouth of Cape Fear River. A previous expedition under Gen. Butler, 13-16 December, had failed, but the fleet had remained, and Porter had appealed to Grant to send another force. Terry's troops effected a landing above the fort 13 January. The next morning he was entrenched across the penin-

whelmed his left wing before the right wing, which was widely separated from the left, could reach it. On the 21st Johnston was defeated after sharp fighting, and Sherman marched for Goldsboro, which he reached 23 March.

On 2 March Sheridan advanced up the Valley, defeated Early at Waynesboro, and proceeded through Charlottesville and along the Richmond & L. R.R., destroying roads and stores, and joined Grant at Petersburg. Gen. James H. Wilson, operating under Gen. George H. Thomas, crossed the Tennessee 22 March with a thoroughly equipped mounted force of 12,500, and 1,500 dismounted to follow until horses could be captured. His first objective was Selma, Ala. A portion of Forrest's cavalry was encountered and defeated at Montevallo 30 March. The fortifications of Selma were carried against Forrest 2 April, and immense war supplies and plants for the manufacture of war materials destroyed. Montgomery surrendered 12 April; West Point was captured 15 April,

sula. Early on the 15th the fleet opened a terrific bombardment, which was continued until a force of marines was landed in the afternoon to co-operate in the assault of the army. This was delivered at 3.30 in the afternoon, the flank of the work next the river being carried. Then followed severe fighting for each succeeding traverse. It was not until 10 o'clock at night that the fort was finally carried. Sherman started northward from Savannah 1 February. Marching through swamps, and crossing all streams at flood, he was before Columbia on the 16th. It was surrendered without fighting the next day. Charleston, being cut off from interior communications, was evacuated by Gen. W. J. Hardee 18 February. Fayetteville, N. C., was reached 11 March. The first opposition stronger than skirmishing was at Averashoro 16 March, where Gen. Hardee made a brief stand. On 19 March Johnston's army, which had been collected on Sherman's front at Bentonville, checked his advance and nearly over-

whelmed his left wing before the right wing, which was widely separated from the left, could reach it. On the 21st Johnston was defeated after sharp fighting; Columbus was carried by a night assault 16 April; Macon surrendered 20 April. Here Wilson received notice of the Sherman-Johnston truce. An expedition, sent out 7 May by Wilson from Macon, under Col. Pritchard, Fourth Michigan, captured Jefferson Davis, 10 May, at Irwinsville, Ga. On 6 February the Confederates made a heavy attack at Hatcher's Run on Grant's left, but were finally repulsed with a Union loss of about 1,500. The night of 24 March Gen. J. B. Gordon made a daring and most successful assault upon the right of Grant's lines at Petersburg, capturing Fort Stedman and three strong works. These were recaptured the next day.

The Army of the Potomac was the last to move in the opening campaigns of 1865. It had occupied its lines before Petersburg without general movement from November till the last of March. The general movement, which was to the left, began on the 29th, and brought on

## CIVIL WARS OF ROME—CIVILIS

the battle of Dinwiddie Court House and White Oak Road on the 31st, and the battle of Five Forks on April 1st, in which latter engagement the Confederates were defeated. On 2 April the Confederate entrenchments were carried, and Gen. Lee abandoned his lines during the night, having notified President Davis during the forenoon that he would begin a retreat on Amelia Court House that night. Jefferson Davis received this dispatch in church. He and his Cabinet immediately collected personal effects and Confederate archives, and left Richmond on a special train. Gen. Godfrey Weitzel received the surrender of the city on 3 April.

Gen. Lee's army was assembled at Amelia Court House 5 April, and continued its retreat at night. On the 6th Gen. Meade advanced on Amelia Court House, but, finding that Gen. Lee had left, he moved toward Deatonville (Sailor's Creek), where the most of Ewell's corps, the rear of Lee's army, was captured 6 April. About the same time some 10,000 men of the divisions of Anderson, Pickett, and Bushrod Johnson, were captured. Lee continued his retreat and reached Farmville on the morning of the 7th. Here his troops received their first rations since the retreat began. At 11 o'clock, Union troops appearing, the march was renewed, his men being greatly exhausted with loss of sleep, hunger, and hard marching. On this day the correspondence began between Gens. Grant and Lee, which, on the 9th, resulted in the surrender of Lee's remaining forces at Appomattox. The number paroled was 28,231 officers and men, extra duty men, and detailed men of every description, this remnant being all that was left within the control of Gen. Lee of his magnificent fighting machine, the Army of Northern Virginia.

In North Carolina Sherman and Schofield moved against Johnston, occupying Raleigh 13 April. On the 14th Johnston asked for a conference, and on the 18th terms of surrender were agreed upon, subject to the approval of the President of the United States. These, being deemed in part political, were disapproved, and Gen. Grant was sent to Raleigh to insist upon the same terms made with Lee. These Gen. Sherman demanded of and received from Gen. Johnston 26 April, and the War was over, though small independent forces were in the field for a short time thereafter, Gen. Dick Taylor, in Alabama, not surrendering to Gen. Canby till 4 May.

President Lincoln made nine calls for troops during the War. Under these about 2,800,000 men of all classes were enlisted, including emergency men of a few weeks, three, six, and nine months' men, two and three years' men, conscripts and substitutes. There were 52,000 drafted men held to service; 75,000 conscripts who sent substitutes; and 42,000 men who sent substitutes, although not themselves drafted.

The Confederate records are very deficient, having been largely destroyed. The best estimate from the data in the possession of the war department places the Confederate strength at something over 1,000,000. After Mr. Davis' calls of the first year a general conscription act was passed 16 April 1862, including all white men between the ages of 18 and 35 for the term of 3 years. On 27 Sept. 1862, this act was extended to include those of 45 years. On 17

Feb. 1864, the law was extended to those between 17 and 50, the term to be for the war.

According to the latest compilation of the record and pension office of the War Department, the total number of deaths from all causes in the Union army during the War was 359,528. As many records are incomplete, the actual number must be somewhat larger. On the basis of the figures given, there were killed in action, 67,058; died of wounds received in action, 43,012; died of disease, 224,586. The Confederate losses were quite as severe in proportion to strength, but the records are wanting to such an extent as to make definite estimates of little value.

H. V. BOYNTON.

**Civil Wars of Rome, The**, in their widest extent began with Tiberius Gracchus, and terminated with the election of Octavius Augustus to the empire, 133-131 B.C. In a more limited sense they mean the contest between Caius Marius and Cornelius Sylla, or Sulla (88-78 B.C.). The original cause of the civil war was the struggle between the oligarchy and the democracy of Rome. This struggle lasted till Sylla restored the senate to sovereignty; but this sovereignty was soon disturbed by Julius Cæsar (q.v.).

**Civilian**, in common speech a word denoting a person whose employments are wholly of a civil character as distinguished from one who belongs to the army or navy, while in legal acceptance it designates one who is learned in civil or Roman law.

**Civilis**, Germanic leader of the Batavi in their revolt against the Romans, 69-70 A.D. At one time he held a command in the Roman army, but being more than once charged with treason he escaped and roused the Batavians, his countrymen, to rebellion. Pretending to espouse the cause of Vespasian against Vitellius, he raised a powerful army, and inflicted severe defeats on the Romans. An imposing force sent against him he routed and shut up in the military station, *Vetera Castra*, which after a long siege capitulated, on which all its defenders were slaughtered. Fortune at last for-

## CIVILIZATION—CIVILIZATION IN EUROPE

sook him, and he had to negotiate with the Romans, the Batavians returning to their allegiance. His fate is unknown.

**Civilization** (from the Latin *civilis*, "like a citizen" (*civis*), that is, having the virtues or qualities of a citizen), a term that may mean many things, but is commonly applied to the upward movements of peoples toward higher intellectual, moral, social, and industrial altitudes. "Whatever," says John Stuart Mill, "be the characteristics of savage life, the contrary of these, or the qualities which society puts on as it throws off these, constitutes civilization." The word means, therefore, social progress, the improvement or perfecting of the laws, both written and unwritten, which make for security and peace, and the harmonious development of individual life. The word is often used relatively, meaning the dominant influences of the present period, as when we speak of "our civilization." The most eminent writers who have dealt with this subject have chosen to treat it in different ways. Guizot in his history writes of political or institutional progress, and thus his definition of civilization differs from that of Buckle, who, minimizing institutions as resultant forces, treats the individual as paramount. Many are the influences that determine the character of civilization. Among these Buckle places climate, soil, food, and what he terms the "General Aspect of Nature." To these influences he attaches, perhaps, undue importance, inclining to the minimizing of those innate or inherited qualities in the different races of mankind. His history is written from the view-point of a necessitarian. His theory that moral truths are stationary, intellectual truths alone progressive, and that religion has done more harm by its persecutions than good by its moral and spiritual ministrations, must be taken as showing the bias of an otherwise valuable work, the chief merit of which is its assertion of the claims of the individual against interference in the name of authority. Not all writers hold to the view that our present civilization is a development from primitive rude conditions, but, on the contrary, contend that it was the original state of mankind from which the savage races have in reality descended, and that our present civilization is therefore an artificial approximation to conditions prevailing before the descent. But the other view—namely, that civilization is a development out of barbarous beginnings—is the one commonly held.

A kind of civilization may exist based upon laws and customs which constitute a survival of barbarism, and which are working for the overthrow of institutional civilization which other forces are laboriously building up. Thus ancient civilizations, the democracies of Sparta and Athens, were based upon slavery—the civilization of much of Europe, upon a burdensome militarism that saps its strength. It is hard to say what constitutes a true civilization judged by its fruits, but it may be said to be based primarily upon respect for human rights. Wherever a society exists in which classes are deprived of the fullest participation in its opportunities, there, it may be said, true civilization cannot flourish, however brilliant may seem its achievements, however pleasing its outward countenance, however gracious its aristocracy. **Civilization is progress** (Guizot's definition)

only as society moves forward as a whole. Nor is it in its arms and powers of conquest, but in its domestic virtues that its greatness consists. Augustus did more to make lasting the greatness of imperial Rome when he strove to promote her domestic life and her civic virtues than did the long line of emperors who sought the destruction of her rival cities. Civilization is not a chain in which every link is apparent, though doubtless such links there are. With the age of Charlemagne, the old civilization receded, and the new was born. But this was so only in appearance, since the race is forever in process of development; it is at no one minute what it was the minute before. Every period marks as stupendous if invisible a change from the old to the new. The ancient bonds are not broken; they loosen and fall off. The spectacle of nations rising to greatness from small beginnings, and then slowly sinking, the prey to conquerors from without and internal forces from within, has constituted the perpetual enigma to those who have written histories of civilizations. Yet some later science of history will make the secrets of their decay and death as obvious as the methods by which in their beginnings they rose to greatness and power. The reasons will be found in the denial of natural justice and natural equality among men. From the past it may be predicted with tolerable safety that there will be progress on the whole; that the progress will be intermitted and interrupted; and that it will never, perhaps at the best, be quite as satisfactory as it might be.

**Bibliography.**—Buckle, 'History of Civilization'; Guizot, 'History of Civilization'; MacKinnon, 'History of Civilization'; Kidd, 'Principles of Western Civilization'; Draper, 'Intellectual Development of Europe'; Maine, 'Village Communities in the East and West'; Tylor, 'Researches into the Early History of Mankind'; Tylor, 'Primitive Culture'; Wachsmuth, 'Allgemeine Kulburgeschichte.'

**Civilization, An Introduction to the History of**, a noted work by Henry Thomas Buckle, published 1857-61. Although the progress of science has uncovered facts that prove the weakness of an occasional principle in the 'History of Civilization,' the work remains one of the greatest popular contributions of modern times to the new aspect of history, as a human document, to be read by the light of scientific discovery. No book of its time was more influential in turning the direction of men's thoughts to the phenomena of social and political science.

**Civilization in Europe**, a history, by François Guizot. In this work Guizot begins with the fall of the Roman empire, and ends with the opening of the French Revolution. Although he analyzes all the important facts of history between the great landmark of 476 and the convocation of the States-General in 1789, he is far more anxious to grasp their import than to give a vivid relation of them; and therefore, facts in themselves play but a small part in his exposition. They are simply a help in his effort to discover the great laws that direct the evolution of humanity, and to show its development in the individual and in society. His investigations are limited to purely social development, and he does not touch upon the intellectual side of the question.

**Civita-di-Penne**, chē-vē'tā dē pēn'nā, Italy (the ancient PINNA-VESTINA), a small town in the province of Teramo, Naples, built on two hills, 29 miles east by north of Aquila. It was formerly a place of importance. The Normans, under Roger I., made it the capital of their kingdom.

**Civita-Vecchia**, chē-ve'tā vēk'kē-ä. See CITTA VICCHIA.

**Civitali, Matteo**, māt-tā'ō chē-vē-tā'lē, Italian sculptor and architect: b. Lucca 1435; d. 1501. He followed the occupation of a barber until about 1470, when he suddenly rose to the highest rank among the sculptors of his time. His first important work was the mausoleum erected in the cathedral at Lucca to Pietro de Noceto, secretary to Pope Nicholas V. His greatest works are six statues of white marble in the same church, representing personages of the Old Testament. Among his architectural works is the Bernardini palace at Lucca, of simple style, and also the little temple which contains the miraculous crucifix in the church of St Martino. The Uffizi Gallery at Florence contains Civitali's statue of 'Faith.'

**Civoli**, chē-vō lē, **Ludovico**. See CIGOLI LUDOVICO CARDIDA.

**Clackmannanshire**, klāk-mān'an shēr, Scotland, the smallest county, being only about nine miles long, seven wide, and comprising an area of about 35,160 acres or 55 square miles. By the recent readjustment of county and parish boundaries the parish of Alva, formerly a detached portion of Stirlingshire, was added to the county, increasing its area by over 5,000 acres. It lies on the north side of the Forth, by which it is bounded southwest. On all the other sides it is enclosed by the counties of Perth, Fife, and Stirling. The north part of the county is occupied by the Ochil Hills, but the other portions are comparatively level, and in general are exceedingly fertile, yielding large crops of oats, barley, wheat, and beans, turnips, and other green crops. The minerals are valuable, especially coal, which abounds. There are ironworks, breweries, and distilleries, woolen manufactures, tanning, glass-works, etc. The principal towns are Alloa (the largest), Alva, Tillicoultry, Dollar, and Clackmannan; the last is nominally the county town. It is rather poorly built, but has an interesting old tower and an old market-cross. Pop. (1901) 32,019.

**Clacton-on-Sea**, England, a popular watering-place on the coast of Essex, 15 miles southeast of Colchester, with admirable facilities for sea-bathing, and of easy access from London both by railway and steamboat. It stands on cliffs over 40 feet high, and has a town-hall, a church in the early English style; a long ocean pier, etc. Pop. (1901) 7,453.

**Cladel, Léon**, lā-ōn klā-dēl, French romancist: b. Montauban 1855; d. 1902. He rose suddenly into prominence with his story, 'The Ridiculous Martyrs' (1862), a satirical description of the lower walks of literature in Paris. This first success was repeated with the later novels: 'Eral the Tamer'; 'One Quael'; the 'My Peasants' series; 'Barefoot'; 'A Woman Under Ban,' for which he suffered four weeks' imprisonment; and many others.

**Cladium**, klā'dī-ūm, a genus of plants of the sedge family (*Cyperaceæ*), with about 30

species natives of tropical or temperate climes. There are only three species found in America, of which the most common is the twig-rush (*C. mariscoides*), found in marshes from Minnesota eastward to Nova Scotia, and southward to Florida. This plant is very common in certain of the fenny districts of England, where it is used for thatching.

**Cladocera**, klā-dōs'e-ra, a group of *Crustacea* forming a sub-order of the order *Branchiopoda*, and by some authors regarded as an independent order. It is represented by the little water-flea, *Daphnia*, in which the body, consisting of few segments, is protected by a bivalvular shell, though the head, with its antennæ, is uncovered. The legs are short and leaf-like. It lays summer and winter eggs, the latter enveloped in a peculiar shell, the "ephippium," and the young develop in a space between the shell and the back of the animal, which forms a brood-pouch.

**Cladrastis**, klā-drās'tis, a genus of the pea family, with two species, one in Manchuria, the other (*C. lutea*) in eastern United States. The American or Kentucky yellow-wood is a species with smooth bark, and sometimes grows above 50 feet in the rich soils of Kentucky and Tennessee. The wood, which weighs about 40 pounds to the cubic foot, is strong and hard, and of a bright yellow color. It produces a dye of considerable commercial value.

**Clafin, Horace Brigham**, American merchant: b. Milford, Mass., 18 Dec. 1811; d. Fordham, N. Y., 14 Nov. 1885. He received a common school education, worked in his father's store until he was of age, when he went to Worcester, Mass., and in partnership with his brother-in-law, engaged in the dry goods business on a large scale. In 1843 he established in New York the firm of Bulkley & Clafin, importers and jobbers of dry goods; in 1851 it became Clafin, Mellin & Company, and in 1864 H. B. Clafin & Company, by which it is best known. Mr. Clafin conducted an enormous business extending all over the country, and since 1864 it has been the largest mercantile business in the United States, its sales in a single year having reached \$72,000,000. Its financial strength, and the money markets' firm confidence in Mr. Clafin's methods and integrity, enabled the firm to pass safely through most of the financial crises of the last 40 years. In 1861 and in 1873 it had to ask for slight extensions of time in which to settle accounts, but all were paid with interest before maturity. Mr. Clafin was a man of domestic tastes, fond of books and horses, a regular attendant of Plymouth Church, Brooklyn, and an intimate friend of his pastor, Henry Ward Beecher.

**Clafin, Mary Bucklin**, American prose writer: b. Hopkinton, Mass., July 1825; d. Whitinsville, Mass., 13 June 1896. She was the second wife of William Clafin (q.v.). For 18 years she was a trustee of Boston University; and of Wellesley College from its foundation till her death. Among her publications are: 'Brampton Sketches'; 'Recollections of Whittier'; and 'Under the Elms.'

**Clafin, William**, American governor: b. Milford, Mass., 6 March 1818. He was educated in the public schools and at Brown University. For many years he was engaged in

## CLAFLIN UNIVERSITY — CLAIM

the shoe and leather business in St. Louis, Mo., but later settled in Boston, Mass. He was elected to the State House of Representatives 1849-52; to the Senate 1860 and 1861; was a member of the Republican National Committee 1864-75; lieutenant-governor of Massachusetts 1866-9; and governor 1870-2. From 1877 to 1881 he was a Republican member of Congress. The degree of LL.D. was conferred on him by Harvard and Wesleyan universities.

**Clafin University**, a co-educational institution in Orangeburg, S. C.; organized in 1869, under the auspices of the Methodist Episcopal Church, exclusively for the colored race. Professors and instructors, 31; students, 713; volumes in the library, 5,600; grounds and buildings valued at \$150,000; income, \$14,000; president, L. M. Duntton, A.M., D.D.

**Claghorn, Kate Holladay**, American writer: b. Aurora, Ill., 12 Dec. 1863. She was educated at Bryn Mawr College, and has been engaged in research work for the United States Industrial Commission. Besides contributions to periodicals, she has published 'College Training for Women' (1897).

**Claiborne**, klā'börn, or **Clayborne**, William, American colonial adventurer: b. Westmoreland, England, about 1589; d. about 1676. He was of good family and became surveyor of the Virginia plantations for the London Company in 1621; settled at James City, and acquired 45,000 acres of land. In 1625 he was commissioned by Charles I. a member of the colony's council, and its secretary of state. In 1628-31 he received commissions, and in 1631 a royal patent, for discoveries and trade with the Indians; and about 1631 discovered and partially planted Kent Island in Chesapeake Bay, which settlement was accorded a Burgess in the Virginia Assembly. In 1632 Lord Baltimore was given his Maryland charter, saving the rights of previous settlement; and his first colony arrived in March 1634. Finding Claiborne's island within his limits, he at once claimed title to and sovereignty over it, alleging that Claiborne's patent was only a trading right, giving neither title to soil nor political rights. Claiborne, however, claimed both ownership and independence, in which Virginia sustained him. He was at this time carrying on an extensive Indian trade in partnership with a London house in armed vessels, and he endeavored to prejudice the Indians against the new colony. Capt. Cornwallis of the latter retaliated in 1635 by assailing and capturing one of his vessels, in a fight in which several lives were lost. This misfortune, and the burning of his warehouse, aroused the suspicions of his partners, who sent out an investigating agent, to whom he turned over the Kent Island property and went to England. There he was sued for account, and indicted for rebellion; but this seems not to have been pressed. Meantime the agent seized all Claiborne's Virginia property, and acknowledged Baltimore's title and sovereignty in Kent Island. Claiborne then bought Palmer's Island at the head of Chesapeake Bay, supposing it beyond Baltimore's grant, and asked the king for an injunction to restrain Baltimore from interfering with him, and for a grant of lands along the Susquehanna. The king referred it to the commissioners of plantations, who ignored the purchase, refused the grant, and sent him to

the courts for the injunction. Claiborne's party in Kent Island continuing insubordinate, Gov. Calvert reduced it and seized Palmer's Island also. Ousted from all his settlements, Claiborne petitioned for a grant of some island he might discover *within* the company's patent. This, too, was refused, but Charles made him treasurer of Virginia for life. He at once became a leading political director. During the English civil war that followed, Virginia clung to the royal cause, while Baltimore trimmed sail, and in 1644 Claiborne attempted to raise Kent Island against the proprietary government, as Roman Catholics and hostile to the king. He failed, but in 1645 an English captain, professing a parliamentary commission, overturned the Baltimore government altogether for a time. On the execution of Charles I., Virginia and Maryland, through its royalist deputy, proclaimed Charles II. Claiborne now joined the party of Parliament and was accordingly commissioned to reduce Virginia and Maryland to obedience. In 1652, accordingly, his expedition deposed Gov. Berkeley of Virginia, appointed a new governor, with Claiborne secretary of State, and forced Gov. Stone of Maryland to swear allegiance to Parliament. When Parliament was turned out by Cromwell, Stone repudiated the oath, whereupon Claiborne marched on Maryland with an armed force, deposed Stone, and appointed a Puritan administration, which at once disfranchised all the Roman Catholics. Cromwell intervened in their favor in 1654, and Stone undertook to recover his position by force, but was defeated and captured. Claiborne held his advantage till 1658, when Baltimore had his province restored to him. On the Restoration, in 1660, Claiborne was dismissed from the council and secretaryship of State. In 1675, on Cecilius Calvert's death, he petitioned the king for redress of his wrongs from the Baltimores, but no attention was paid to his request. His descendants in the South numbered many able and distinguished men, and are commemorated in town and county nomenclature. He was a man of enormous energy, resource, and pertinacity, a true type of the English adventurers who have overrun the world; but too inconsiderate and personal in policy for the largest success.

**Claiborne, William Charles Cole**, American senator: b. Sussex County, Va., 1775; d. New Orleans, La., 23 Nov. 1817. He received a good education, studied law, and engaged in its practice in Nashville, Tenn. He assisted in forming the constitution of Tennessee, and represented that State in Congress 1797-1801. In 1801 he was appointed governor of Mississippi Territory, and in 1804 of Louisiana. When the latter became a State and adopted its constitution, he was elected governor 1812-16. He was later elected United States senator, but died before taking his seat in that body.

**Claiborne Stage**, in American geology, the rocks, principally shales and limestones laid down in Middle Eocene time along the Carolinas and the Gulf States and around an arm of the sea that reached northward to the present mouth of the Ohio River. See EOCENE SERIES; TERTIARY SYSTEM.

**Claim**, a challenge of ownership of a thing which is wrongfully withheld from the possession of the claimant. The assertion of

## CLAIMS — CLAIRVOYANCE

liability of some one, to the party making it, to do some service or pay a sum of money. The possession of a settler upon lands owned by a government which is not used for any particular purpose, and from which no benefit is derived. When a new section of country is opened up, the government gives to each settler a certain amount of land on condition that he will live there, and improve and cultivate the soil for a definite time. The land taken is called a claim, and the settler receives an absolute title to the property when the conditions have been complied with. The ground must be staked out so that the particular claim may be identified. Mining claims are of this nature. Generally it is required that they be staked out, that a description of the claim be filed, and that a certain amount of work be done within a specified time. These claims are considered personal property until the conditions are complied with, and are subject to sale and transfer, it being necessary for all but the original settler to be able to show how and through whom he acquired title, in order to get a complete and absolute title from the government, as it is necessary to show that the land has been used, and in what manner, for a definite length of time, before the settler acquires his title from the government.

There are claims for labor and wages by mechanics for work done, by material-men for material furnished, or by pilots for pilotage. When filed of record these claims become liens against the property which has been benefited by the work, material, or care bestowed upon it.

Claims, when filed in the name of a municipal corporation for improvements, such as opening or widening a street, laying sewers, or any municipal improvement, are liens against the property benefited.

**Claims, Court of.** See COURTS.

**Clairac**, klā-rāk, France, a town in department Lot-et-Garonne, on the Lot. It was the first town in the south of France to declare in favor of the Reformation. Pop. 2,388.

**Clairaut**, klā-rō, Alexis Claude, klōd, French mathematician: b. Paris 7 May 1713; d. there 17 May 1765. In his 11th year he composed a treatise on the four curves of the third order, which, with his subsequent 'Researches on Curves of Double Curvature' (1731), procured him a seat in the Academy at the age of 18. He accompanied Maupertuis to Lapland, to assist in measuring an arc of the meridian, and obtained the materials for his work 'On the Shape of the Earth.' In 1752 he published his 'Theory of the Moon,' and in 1759 calculated the perihelion of Halley's comet. A brother, who died at the age of 12, published in his ninth year a treatise entitled 'Divers Quadratures of Circular Elliptics.'

**Clairin**, George Jules Victor, zhōrhzh zhül vëk-tōr klā-rān, French portrait painter: b. Paris 11 Sept. 1843. He studied in Paris under Picot and Pils, and obtained a second class medal at the Paris Exposition in 1889, and the Legion of Honor medal in 1888. Beside portraits he has painted several brilliant scenes from Spanish history.

**Clairvaux**, klār-vō' (*clara vallis*, lightsome vale), a village of France on the river Aube, 10 miles southeast of Bar Sur-Aube, noted as the site of the celebrated abbey of Cistercian monks, founded in 1115 by Saint Bernard, who was

its abbot till his death in 1153. It was a vast establishment, comprising within its enclosure a large population both of monks professed, lay brothers, laborers and artisans employed in various industries. There was a large and magnificent church; four cloisters surrounded by buildings for housing the monks, *conversi* or lay brothers, the novices and the superannuated members of the order; the abbots' hall with the guest house adjoining it, the kitchen, refectory, infirmary, scriptorium, etc.; all these were grouped in one portion of the monastic domain. In another portion were the fish tanks, the wine press, slaughter house, barns and stables, saw-mill, grist-mill, oil-mill, tannery, tile works, etc., producing all necessary supplies for the use of the inmates. At the Revolution the monks were turned out, and the lands and buildings, except the church which was destroyed by fire, were occupied for public uses: the buildings are now used as a penitentiary and workhouse.

**Clairville**, Louis François, loo-ē frān-swā klār-vël, French writer of light comedy: b. Lyons 1811; d. 1879. He was the author of more than 220 comedies, farces, and comic-opera libretti. Among his most successful operettas are: 'Daphnis and Chloe' (1849); 'Mme. Angot's Daughter' (1873); among his vaudevilles: 'Property Is Robbery' (1848); 'Antoinette's Temptations' (1850); 'Cinderella' (1866).

**Clairvoyance**, defined as the power of perceiving without the use of the organ of vision or under conditions in which the organ of vision with its natural powers alone would be useless. It comprises the sight of things past, present, or future. Various methods of clairvoyance are recounted; by direct vision of things at a distance (opaque substances being no hindrance); by looking into a black surface; by looking into water, into a crystal, etc.; or by laying the object to be described on the forehead or chest of the clairvoyant; but clairvoyants now usually represent the cerebral region as the seat of illumination. From remote antiquity the possession of such powers by favored individuals has been believed. In the Old Testament (2 Kings vi. 15-17) is an account of the opening of the inner vision in the case of the servant of Elisha in answer to the prayer of the prophet.

Clairvoyant powers were claimed for the Pythia at Delphi. Apollonius of Tyana and Diodorus Siculus testify to the clairvoyance of the Indian sages. Macrobius gives an instance of clairvoyance on the part of the oracle of the Heliopolitan god when consulted by the Emperor Trajan. Tertullian speaks of a seeress who could prophesy and prescribe for the sick. Clairvoyance was known among the nations of antiquity, and is still generally accepted as an undoubted fact among Eastern nations. As instances of clairvoyants in later times may be mentioned Jacob Böhme (1575-1624) and Emanuel Swedenborg (1688-1772), the Swedish scientist and founder of the religious body called 'The Church of the New Jerusalem.'

The phenomena of clairvoyance have been carefully observed. The clairvoyant state seems to be intimately connected with the mesmeric, the somnambulist, and the so-called 'biological.' Mesmeric somnambulism and clairvoyance were first brought to notice by Puysegur in 1784. The clairvoyant is usually in a state of trance, which may be induced by mesmeric

## CLAM — CLAOSAURUS

passes. In this state he is sometimes conscious only of his mesmerizer; in others, his clairvoyance is unrestricted; but the clairvoyant may enter the trance state spontaneously, or he may even be in possession of his ordinary faculties, both of which characteristics are to be found in Zschokke, the German novelist. In "second-sight," as found in Denmark, parts of Germany, and especially in the Highlands of Scotland, the seer is not in a state of trance similar to that in other forms of clairvoyance. Some modern scientists claim that the discovery of the X-rays, by Röntgen, in 1895, has solved a number of the questions raised by clairvoyance.

**Clam.** While the vernacular name clam is indiscriminately applied to any large edible bivalve, it is generally given to the northern "long" or soft-shelled clam (*Mya arenaria*), in distinction from the round clam, hard-shell clam, or quahog (*Venus mercenaria*), which extends from Cape Cod southward, though occasionally found as far north as the Maine coast (Casco Bay) and the Gulf of St. Lawrence at Shediac.

The long or soft-shelled clam occurs throughout the north Atlantic coast from New York to Greenland, and on the British shores, and is everywhere on the American coast a valuable article of food. The so-called black "head" is the siphon, which is very extensible and divided by a fleshy partition into two passages, opening out by two orifices surrounded by a circle of delicate sensitive tentacles; into the lower opening passes the sea-water, carrying minute animals, young and old, and diatoms, around to the mouth, which is in the larger end of the body; through the other or upper opening of the siphon the excrementitious matter is expelled. The clam has a tongue-shaped "foot," by which it burrows into the mud or sand to a depth of several inches.

The clam may be of either sex, male or female; it is very prolific, extruding an inconceivable number of eggs into the sea, where they are fertilized. The young larvae (veligers) swim at the surface, where they are borne in all directions, until in a few days, the shells becoming heavier, they sink to the bottom, and, resting on the seaweed or stones at the bottom, the "spat" become attached by a few byssus threads. Clams begin to spawn by the end of the first year of their life, and in Narragansett Bay are sexually mature and the eggs become ripe when the animal is only an inch long. The breeding season begins in May, reaches its height in June, ending in July. Of course clams cannot feed when the tide is out, hence they grow more slowly when living near high-tide line. When the young begin to burrow, and they dig very rapidly during the first two months of their life, when one quarter to one half inch in length, they are attacked by crabs, eels, and starfish (q.v.). In Rhode Island attempts at restocking clam beds and raising clams artificially have met with success and promise valuable results in clam-culture. Clams have been taken five and three quarters inches long, and weighing 15 ounces. Attempts have been made to plant the clam on the Pacific coast.

The round, or little-necked clam, or quahog, as it is called in New England, lives in the sand from Cape Cod to Texas, just below low-

water mark, and abounds at the mouth of estuaries. The shell is heart-shaped, the valves very thick and heavy. This bivalve is fished by means of long rakes and tongs, or is dredged like oysters. It has a very large "foot," and plows through the sand, but does not burrow deeply.

The beach, surf, or hen clam is *Spisula* (formerly *Macra*) *solidissima*. The large edible species of the southern coast is the painted clam (*Callista gigantea*). Several large Pacific coast bivalves are edible and known as clams, being species of Taper, Laxidomus, and Glycimens. Very unlike any edible clam is the "giant clam" (*Tridacna gigas*) of the coral reefs of the Pacific Ocean, whose shell often weighs upward of 400 pounds. Consult: Mead, '30-33d Annual Reports of the Commissioners of Inland Fisheries of Rhode Island.'

**Clamecy**, klä-mê-sê, France, a town in the department Nièvre, 38 miles northeast of Nevers, left bank Yonne, at the mouth of the Beuvron. It was formerly surrounded by enormous walls, and defended by a castle, which commanded the town and environs. One of its suburbs, situated on the opposite side of the Yonne, was the seat of a bishopric in *partibus*, known as the bishopric of Bethlehem, founded in 1180 for the bishop of that place, who had been expelled by the Saracens. Wood-rafts for the supply of Paris with fire-wood are made up here, and floated down the Yonne and Seine. The parish church, founded in 1497, is remarkable for its tower and for some fine sculptures. Clamecy carries on several industries, the chief being that of tanning. Pop. 4,800.

**Clan**, a tribe or number of families, bearing the same surname, claiming to be descended from the same ancestor and united under a chieftain representing that ancestor. The clan system is essentially the same as that existing among the Arabs, the Tartars, and tribes similarly situated. From ancient times the "clans" existed in Ireland. The system is said to have sprung up in Scotland about 1008, while Malcolm II. was reigning, but it may have been of greater antiquity. In 1747 the legal authority of the chiefs over their followers was abolished as a punishment for the part which the former had taken in the insurrection which ended in 1745 at Culloden. While the clans flourished they were divided into two, the clans of the borders and those of the highlands.

**Clan-Na-Gael**, klän-na-gäl, Irish secret society, founded in the United States for the purpose of aiding in securing "Home Rule" for Ireland. The society has been charged with some grave crimes, said to have been perpetrated for the purpose of intimidating the British government; but so little is really known about the workings of the organization, nothing positive can be asserted.

**Claosaurus**, klä-ō-sôr'us, **Trachadon**, trāk'-a-dōn, or **Trachodon**, a genus of duck-billed dinosaurs (see DINOSAURIA) of the Cretaceous Period. This dinosaur was bipedal, herbivorous, resembling the hadrosaurus (q.v.), but the bill was not so broad. Its remains are found in the Upper Cretaceous formations of North America. A mounted skeleton possessed by Yale University is 30 feet long and stands 14 feet high.

## CLAP — CLARE

**Clap, Roger**, American pioneer: b. Salcomb, Devonshire, England, 6 April 1609; d. Boston, Mass., 2 Feb. 1691. He came to America in 1630, and with other colonists settled the present Dorchester, Mass. In the course of his life he held several military and civil offices, being captain of Castle William 1665-86, and representative in the general court 1652-6. His 'Memoirs,' written for the instruction and benefit of his children, were originally published by Rev. Thos. Prince (1731). Other editions are: 'Memoirs of Roger Clap; Relating Some of God's Remarkable Providences to Him in Bringing Him Into New England' (Boston 1807; Pittsfield 1824; and an edition with preface, etc., printed by the Dorchester Antiquarian and Historical Society, Boston 1844).

**Clap, Thomas**, American clergyman: b. Scituate, Mass., 26 June 1703; d. New Haven 7 Jan. 1767. He was settled as a minister at Windham, Conn., in 1727, and in 1739 was elected president of Yale College. He contributed much to improve that institution, and was the means of building a college edifice and chapel. He was a man of extensive erudition, gave great attention to mathematics and astronomy, and constructed the first orrery made in this country. He published a 'History of Yale College' (1766); 'Nature and Foundation of Moral Virtue and Obligation' (1765); 'Nature and Motion of Meteors' (1781); etc.; and had made collections for a history of Connecticut; but most of his manuscripts were plundered in the expedition against New Haven, under Gen. Tryon. He had a controversy with President Edwards respecting Whitefield, and opposed the latter, not so much upon religious grounds as from a misapprehension of Whitefield's designs.

**Clapboard**, klăp'bôrd, colloq. klăb'ôrd, a thin, narrow board commonly used for covering the sides of wooden buildings. Clapboards are usually of white pine, and are made much thinner on one edge than on the other, so that when nailed on to each other one can lap a little over the one next below it. This makes the covering of the building much tighter than if the boards were only set together one above the other, and keeps the rain from driving in. Clapboards are sawn out of solid logs, not by sawing them clear through, as in making common boards, but by sawing from the outside to the middle or heart of the log. They are thus made thicker on the outside than on the inside. They are afterward smoothed in a planing machine.

**Clapham**, klăp'am, a southwest suburb of London, lying a mile south of the Thames. Clapham Common is still an open common of 200 acres. Clapham Junction, in Battersea parish, is one of the busiest and most perplexing railway junctions in the world.

**Clapham Sect**, a name given by Sydney Smith to the Evangelical Party in the Church of England; the Rev. Henry Venn was the vicar of Clapham, and some of the most eminent Evangelicals—Zachary Macaulay, Wilberforce, and the Rev. W. Romaine—lived there. Thackeray's 'Newcomes' has made the phrase familiar to a later generation.

**Clapnet**, a ground net used by bird catchers, consisting of two equal parts about 12 yards long by 2½ wide, and each having a

slight frame. They are placed about four yards apart, and are pulled over by a string so as to enclose any birds on the intervening space.

**Clapp, Henry Austin**, American dramatic critic: b. Dorchester, Mass., 17 July 1841. He has been for many years clerk of the supreme judicial court of Massachusetts, and a well-known dramatic critic on the Boston press. He has also lectured extensively on Shakespeare. He has published 'Reminiscences of a Dramatic Critic' (1902).

**Clapperton, Hugh**, Scottish explorer: b. Annan, Dumfriesshire, Scotland, 1788; d. near Soccatoo, central Africa, 13 April 1827. He entered the merchant service, but was impressed into the navy, in which he became a lieutenant in 1816. He then went to Africa, where he remained till 1825, returning with valuable information, though the disputed question of the course of the Niger was left undecided. On his return to England Clapperton received the rank of captain, and immediately engaged in a second expedition, to start from the Bight of Benin. Leaving Badagry in December 1825, he penetrated to Katunga, within 30 miles of the Quorra or Niger, but was not permitted to visit it. At Soccatoo the Sultan Bello refused to allow him to proceed to Bornu, and detained him a long time in his capital. He was the first European who traversed the whole of central Africa from the Bight of Benin to the Mediterranean. See Landor, 'Records of Captain Clapperton's Last Expedition' (1830).

**Claque**, klăk, a body of paid applauders at a public performance, according to tradition, an invention of Nero's. At the present time the claque is a recognized feature of theatrical management in Paris, and although said to be employed in London and New York, the use of such artifices is not recognized as legitimate outside of the French capital.

**Clare, Saint, or Saint Clara**, Italian nun: b. Assisi 11 July 1194; d. 12 Aug. 1253. When very young she was attracted by the accounts of the work being done by Saint Francis (q.v.), a young man of her native place. At an early age she decided to give her life wholly to God and to work for him in poverty. She sought and received the advice of Saint Francis, and when only 18 years of age, gave up the world, and began to devote herself wholly to charity. Other pious young women soon joined her and in time a recognized religious order was founded. For some years they had no special rule, but in 1218 they adopted the rule of Saint Benedict. Later (1224) Saint Francis gave them a rule, mitigating the rigors of the fast, but recognizing holy poverty in the extreme. Two years after her death she was canonized by Alexander IV. The order which she founded is known throughout the world as "Poor Clares"; but several branches of the order have been established as "Order of Saint Clara," "Capuchin Poor Clares," and the name by which first known, "Order of Poor Ladies." Another and a correct title is "Second Order of Saint Francis." The differences in the branches are the rules of poverty. Saint Clare allowed none of her nuns nor herself to hold property individually nor as a body. She followed the practice of Jesus Christ. They did not own the houses in which they lived. Some of the branches, as a body, have corporate rights of

## CLARE — CLARENCE

property. Saint Clare is known by the name, "Princess of Poverty."

**Clare, Saint, Order of.** See CLARE, SAINT.

**Clare, Israel Smith,** American historical writer: b. Lancaster County, Pa., 24 Nov. 1847. He has published: 'Illustrated Universal History' (1876); 'Complete Historical Compendium' (1884); 'Library of Universal History' (1890); 'History of British Boer War' (1900).

**Clare, John,** English peasant poet: b. Helpstone, Northamptonshire, 13 July 1793; d. Northampton 20 May 1864. He led a rambling, unsteady life until 1818, when he was obliged to accept parish relief. In 1821 his 'Poems Descriptive of Rural Life and Scenery,' met with a favorable reception, and the issue of his 'Village Minstrel' later in the same year won him many friends. A subscription furnishing him with £45 annually was, however, dissipated by 1823, and his 'Shepherd's Calendar' (1827), which he hawked himself, was not a success. He brought out a new work, the 'Rural Muse,' in 1835, but became insane shortly afterward, and the remainder of his life, from 1837 to 1864, was passed in the Northampton Lunatic Asylum. Clare was a genuine poet, and his pictures of rural life are eminently truthful and pleasing.

**Clare, Ireland,** a county in the province of Munster; boundaries north and east, Galway Bay and county; east and south, the Shannon separating it from Tipperary, Limerick, and Kerry; west, the Atlantic. Area, 827,994 acres, nearly three fourths of which is under cultivation or in use as pasturage, and the remaining portion is in bog, mountain, or under water. The surface is irregular, rising in many places into mountains of considerable elevation, particularly in the east and west and northwest districts. The grazing lands are excellent; the chief minerals are limestone, lead, and slate, and in the southwest coal; but owing to the laws regarding mining, the mineral deposits remain almost undeveloped. The chief crops are oats and potatoes. Sheep and cattle on the hillsides, salmon in Clonderlaw Bay, the rivers Shannon and Fergus and at Dunbeg are sources of income. There are oyster beds near Ballyvaughan and along the shores of Burren. Frieze and hosiery are manufactured. The chief town is Ennis. Pop. (1901) 112,100.

**Clare College,** University of Cambridge, founded in 1326, and first called "University Hall." In 1336 its patronage was given, by Richard de Baden, then chancellor of the university, to Elizabeth de Burgh, sister of the Earl of Clare. Her object in giving of her riches to this college was to educate young men who would become priests, in order to replace the many clergymen who died from the plague. The college has not continued to educate men for the purpose intended by its first patron. Many noted men have been educated in this school. At first there were a master, eight senior, and seven junior fellows, besides scholars and students. Now the 15 fellowships are open to B.A.'s or persons of a higher degree, without restriction as to marriage. A fellowship becomes vacant in five years and 11 months from the time of election, unless the holder occupies at the same time the post of professor, public

orator, etc., in the university, or the post of tutor, dean, bursar, or lecturer in the college. The master and fellows elect to the vacant fellowships, and the master is elected by the fellows. The foundation scholarships are eight of not less than £60, eight of not less than £40, eight of £20, four of £50 per annum each; three of about £60 per annum, tenable for three years, with preference to clergymen's sons; with several minor scholarships. At present there are 18 fellows, 24 residents, and two non-resident scholars, and several undergraduates.

**Claremont, Cal.,** village in Los Angeles County, on the Atchison, T. & S. Fé R.R., 38 miles east of Los Angeles. This is the centre of a large fruit growing and raisin making region, and large crops of oranges and lemons are raised here. It is the seat of Pomona College, a Congregational institution, founded in 1888. Pop. (1902) 1,200.

**Claremont, N. H.,** town in Sullivan County, on the Boston & Maine R.R., 50 miles north of Concord. Water power from Sugar River is furnished here to cotton and woolen mills, paper mills; and there are lumber, granite, and marble yards, shoe factories and brick yards. The Fiske Free Library, founded in 1873, is located here. Pop. (1890) 5,565; (1900) 5,498.

**Clarence, George, DUKE OF,** English prince: d. London, 18 Feb. 1478. He is chiefly celebrated for his tragical end, and for the use made of his name and history by Shakespeare. He was the son of Richard, Duke of York, and brother of Edward IV., king of England, and on his brother's accession to the crown in 1461 he was, as the reward of his assistance, created Duke of Clarence, and in 1462, lord-lieutenant of Ireland. When the Earl of Warwick deserted the cause of Edward, Clarence entered into alliance with him, married his daughter in 1469, retired with him to France, and afterward landed with him at Dartmouth in September 1470, and in a parliament held at Westminster by the Lancastrians had the crown settled on him, failing the issue of Henry VI. From a story told by Commynes, it would appear likely, however, that Clarence had already meditated a double treachery before leaving France, and at Coventry, on 30 March 1471 he left the party he had espoused on the field of an imminent battle, and joined his brother Edward. Clarence's wife having died in 1476, he offered himself, on the death of Charles the Bold, to Mary, heiress of the estates of Burgundy, but the king opposed his suit, which hardly needed his opposition to cause it to miscarry. Some of his servants were about the same time hurriedly put to death on an accusation of magic. Clarence, who had for some time engaged in a rash opposition to the court, now appeared in the council to complain of the injustice of their sentence. For this interference with justice, he was committed to the Tower. A parliament was summoned, which condemned him to death; and on 18 Feb. 1478, he was found dead in the Tower. Of the manner of his death, or by whom it was perpetrated, nothing is known. Suspicion fell on his brother Richard, Duke of Gloucester, on account of their old enmity.
